Other studies have covered Operation Citadel and Operation Desert Storm. In this report, the breaches created in the zone of the 6th New Zealand Brigade are studied in detail. This report has been structured such that the situations of both sides are discussed, followed by a detailed narrative of the operation. Of particular interest to students of military engineering, is the effect of the lack of antipersonnel mines on the effectiveness of the "Devil's Garden." Although this was forced on Generalfeldmarshall Rommel and his men by logistic constraints, it should be of current interest as our soldiers are stripped of conventional mines by 2010. 14. 9<sup>th</sup> Copy

The daily casualties of static warfare requires a shortening of the front in order to gain depth based on the following new organization plan:

1.) The foremost mine obstacles (the former Main Line of Resistance) are to be observed day and night by <u>combat outposts</u>. The night garrison must be as strong as the day garrison. <u>Watchdogs</u> will be supplied to assist the troop detachments with overwatch.

The combat outpost line will consist only of <u>squad strong points</u>. Therefore, extra positions will be used as alternate positions. All new positions will be placed <u>in</u> the minefields. A part of each combat outpost, in the <u>old positions</u> will guard the lanes through the minefields.

The former battleground in the forward portion of the obstacle area remains the maneuver area of the combat outposts and the engagement area for local counterattacks.

- 2.) An area about 1 to 2 km deep will be left unoccupied between the combat outpost line and the main battle area.
- 3.) The M.L.R. (Main Line of Resistance) is to shift to the <u>back</u> half of the <u>obstacle areas</u> (Devil's Gardens). Therefore, the forward edge of the main engagement area lies mostly in the Devil's Garden, about 2 km behind the zone of the combat outposts. These troops positioned in the main battle area are to be organized to a depth of about 2 km.
- 4.) For the present, continue to work toward the new employment given in <u>Attachment 1</u>. Afterwards, establish a battalion sector with a width of about 1 ½ km and a depth of about 5 km. One company of the battalion (without heavy anti-tank weapons) is to be employed in the combat outposts, while the bulk of the battalion is deployed in the main battle area.

In the X Corps sector, the newly won minefields in correspondence with those of the XX Corps are to be used to deepen the obstacle areas.

- 5.) The tasks in Merkblattes für Stellungsbau (Instructional Pamphlet on Fortified Position Construction), as modified by the current instructional Pamphlet (Pz.A.O.K. Ia/Pi Nr.1334/42geh, III. Ang. V. 1.9.42), are to be applied.
- 6.) On 25 September 42, present to the Army Headquarters:
  - a.) A proposal for a new organization with appropriate directions on a 1:25,000 map.
  - b.) A proposal for the development of new obstacle zones.

The execution time for the new organization will be given by special order

Die täglichen Verluste im Stellungskrieg erfordern ein Auflockerung der Front nach der Tiefe. Hierzu ist folgende Neugliederung vorzusehen:

1.) Die vordersten Minensperren (bisherige H.K.L.) sind durch Gofechtsvorpesten Tag und Nacht zu bewachen. Die Nachtbesetzung
muß stärker als die Tagesbesetzung sein. Zur Erleichterung der
Überwachung werden den Truppenteilen Wachhunde zugeführt werden.

Die Stellung der Gefechtsvorpesten hat nur aus Gruppenstützpunkten zu bestehen. Demnach überflüssig werdende Anlagen
sind zunüchst als Wechselstellungen zu benutzen. Bei allen Neuanlagen sind die Gefechtsvorpesten in die Minenfelder zu legen.
Bei alten Anlagen haben Teile der Gefechtsvorpesten in den Minenfeldern die Bewerhung durcheuführen.

Dor bishorige Kampfraum in verderen Teil der Sperrgebiste bleibt Dewogungsraum der Gefechteverposten und Kampfraum für örtliche Gegenstösse.

Tiufo der Gefcentsverpenten de nich Gelände etwa 500

- 2.) Zwischon den Gefechtsvorpesten und dem Houptkampfield ist ein etwa 1 2 km tiefer Raum unbesetzt zu lassen.
- 3.) Die H.K.L. ist in die rückwärtige Wilfte der Sporrgebiete (Teufelsgärten) zu verlegen. Demnach liest der verdere Rand des geKauptkompffoldes der Grösse der Taufelsgärten entsprechend etw
  2 km hinter der Zone der Gefechte verposien. Die im Hauptkompf

fold oingosotzten Truppen sind otwe 2 km tiof zu gliedern.

4.) Einen Anhalt für den demnach durchzuführenden nouen Einsatz
Libt Anlage 1. Denach beträgt die Breite der Btl.-Abschnitte
otwa lik km, die Tiefe etwa 5 km. Eine Kompanie des Btl.
(ohne schwere Pz.Abwehrwaffen) ist als Gefechtsvorposten,
die Masso des Btl. in dem Hauptkampffeld einzusetzen.

Im Abschnitt dos X.A.K. sind die neu gewonnenen Minenfelder entsprechend denen des XX.A.K. zu Sperrgebieten zu vertiefen.

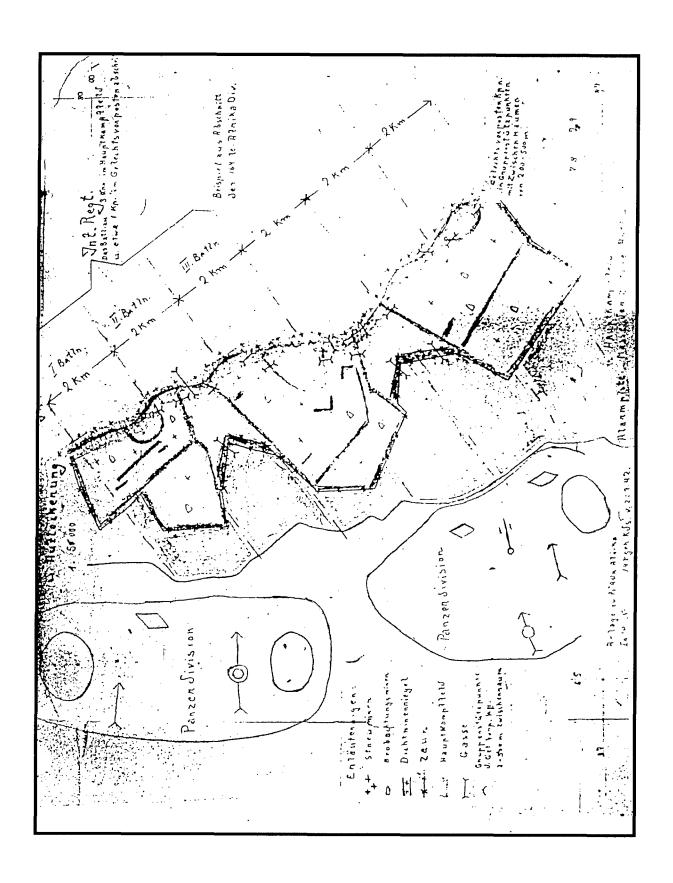

- 5.) Die zur Ausgabe eines abgeänderten Merkblattes für Stellungsausbau ist das bisherige Merkblatt (Pz.A.O.K.In/Pi Nr.1334/ 42 geh. III.Ang.v.1.9.42) sinngemäss anzuwenden.
- 6.) Eun 25.9.42 mind dem 4.0.X. vorzulegen:
  - a) Vorschlag für Nouglicderung entsprechend vorstchenden Richtlinion mit Karte 1: 25 000,
  - b) Vorschlig für neuen Verleuf der Sperrgebietumrendungen, Der Zeitpunkt der Durchführung der neuen Gliederung wird besonders befohlen werden.

## APPENDIX A, ANNEX 2 GENERAL DER KAVALLERIE STUMME'S INSTRUCTIONS, DATED 22 OCTOBER 1942

Headquarters, Panzerarmee Afrika <u>The Commander-in-Chief</u> Abt.Ia/Pi Nr.9532/42 secret Army Command Post, 22.10.42

**Subject: Instructions** 

During times of positional warfare it is most possible to exploit training opportunities. This applies in the front lines to troops not deployed in the fortified position. But also offers an opportunity to the units deployed directly behind the front to train in a limited scope. I give a few guidelines on the training orders of the divisions-on the execution of training-to establish the basis.

#### I. General

- 1.) The attack is and remains the best defense. Therefore, place this form of combat in the forefront of training.
- 2.) A pure defense can never bring success, to wrestle down an attacking opponent. Rather, every defense must change into an attack where the opportunity presents itself. The decision based on local combat conditions must be made lightning quick. The <u>counterthrust</u> is therefore the duty of the local leaders. They must be trained in this. This leader training must be obeyed. The counterattack is the duty of the senior leaders. Each quicker and better prepared to break loose; so greater is the success.
- 3.) The unconditional holding of the position without regard for threats to the flanks, breakthroughs to the sides, or within the position and so on alone guarantees the defensive success. Therefore wiring and mining, as well as all around defense of the battle groups in the line of combat outposts and the M.L.R. are ordered.

The combat outposts and forward strongpoints as well as the M.L.R. are to be held. No leader of the combat outposts is authorized to decide on his own to give up the line of combat outposts. Also a breakdown in communications to the rear does not justify such a decision.

#### II. In Particular.

- 1.) No driving of unarmored vehicles into organized defenses of the enemy without protection (panzers, armored cars) in advance. No concentrations of vehicles or soldiers.
- 2.) Present no targets and locations. Against it: camouflage, adapt to the country and with each halt go to ground.
- 3.) Reconnaissance troops: train reconnaissance and assault troops with the object of reconnaissance, as possible bring in many prisoners and through fire, destroy the enemy.
- 4.) Rapidly breach enemy minefields and belts as well as wire obstacles under enemy defensive fire. The enemy minefield must not be allowed to be a grave to an attack's spirit and drive. In addition training exercises are necessary. Mine detection and removal is only the first step. Protective fire, close engagement of the enemy, smoke, lanes created through all arms and so on.
- 5.) Advance the Infantry through thoroughly planned fire from all infantry support weapons. Ensuring this is the main task of the battalion and regimental commanders in an attack.
- 6.) Exploit the success of the panzers or of the fires of all support weapons including artillery through closely placed infantry, often these will be mounted possibly.

- 7.) <u>Fire discipline! Aimed</u> fire of all weapons including rifles. In addition maneuver the fires of all support weapons for fully effective firing ranges.
- 8.) Application of close combat means. Hand grenades, bayonets, shovels, pistols!
- 9.) <u>Training</u> and <u>schooling of the junior leader</u> up to company commander. For this under different planning games in the smallest scope.
- 10.) Weapons training on as many weapons as possible including captured weapons.
- 11.) Vehicle driver training.
- 12.) <u>Drill exercises</u> only to fortify the discipline of the men, never over half an hour.

Oberkommando der Panzerarmee

A.Gef. Stand, den 22.10.42,

Der Oberbefehlshaber

Abt.Ia Nr. 9532/42 geheim

Betr. 1 Ausbildung.

Die Zeit des Stellungskrieges ist weitmoeglichst zur Ausbildung auszunutzen. Dies gilt in erster Linie fuer die nicht in der Stellungsfront eingesetzten Truppen. Aber auch den eingesetzten Verbaenden wird sich unmittelbar hinter der Front Gelegenheit bieten, in beschraenktem Rahmen auszubilden. Machstehend gebe ich einige wonige Richtlinien, die den Ausbildungs-Befehlen der Divisionen - den Graegern der Ausbildung - zu Grunde zu legen sind.

#### I. Allgemoines.

- 1.) Der Angriff ist und bleibt die beste Verteidigung. Daher steht diese Kampfferm im Verdergrund der Ausbildung.
- 2.) Eine reine Abwehr kann nie den Erfelg bringen, der den angreifenden Gegner niederringt. Jede Abwehr muss vielmehr in Angriff uebergeben, wo sich nur eine Gelegenheit dezu bistet. Der Entschluss dazu wird meist aus der certlichen Kampflage heraus oft blitzschnoll gefasst werden mussen. Der Gegenstess ist daher Aufgabe des eertlichen Fuchrers. Er muss darin geschult sein. Dies gehoort zur Fuchrerausbildung. Der Gegenangriff ist Aufgabe der hoeheren Fuchrung. Je schneller und je besser verbereitet er lesbricht, was groesser ist der Erfelg.
- 3.) Das unbodingto Halton der Stollung ohne Ruccksicht auf Flankonbodrohung, Durchbruoche seitwaerts oder an an-

deren Stellen usw. verbuorgt allein den Abwehr-Krielg. Doshalb ist Eindrahten und Einminen, sowie Bundumverteidigung der Kampfgruppen in der Linie der Gefechtsvorposten und der H.K.L. befohlen worden.

Die Gefechtsverposten und vergeschebenen Stuetspunkte sind bense wie die H.K.L. zu halten. Kein Tuehrer der Gefechtsverposten derf sus eigenem Entschluss die Linie der Gefechtsverposten aufgeben. Auch eine Unterbrechung der Verbindung nach rueckwaerts kann einen solchen Entschluss nicht rechtfertigen.

#### II. Im Einzelnen.

- 1.) Kein Fehren von ungepanzerten Kfz. in den zur Abwehr gegliederten Feind ohne Sicherungen (Panzer, Fz. Spaehwagen) voraus.
  Keine Zusammenballungen von Kfz. und Keempfern.
- 2.) Micht Schoibe seigen und liegen. Dagegen: Tarnen, sich dem Gelaende anpassen und in die Erde gehen bei jedem Helt.
  - 3.) Spaehtrupp: Ausbildung von Spaeh- und Stosstrupps mit dem Ziel sufzuklaeren, mooglichst viel Gefangene einzubringen und den Feind durch Feuer zu vernichten.
  - 4.) Schnelles Weberwinden von fdl. Minenfeldern und -riegeln
    sowie der dahinterliegenden Drahthindernisse im fdl. Abwehrfeuer. Das fdl. Minenfeld derf nicht zum Totengraeber jeden
    Angriffsgeistes und -schwunges werden.

Dazu sind Lehruobungen noetig. Das tochnische Kimensuchen und -boseitigen ist nur der erste Schritt dazu: Feuerschutz, Niederhalten des Feindes, Einnebeln, Gassen schaffen durch alle Waffen usw.

- 5.) Vorschiesen der Juf. durch plenvolles Fauer aller Juf.-Unterstützungswaffen. Hierfuer zu sorgen, ist eine Hauptaufgabe der Btls.- und Egts.-Kare. im Angriff.
- 6.) Ausmitzen der Erfolge der Panzer oder des Feuers aller Unterstuetzungswaffen einschl. Artillerie durch dichtes Heranhelten der Infanterie, Oft wird dies aufgestasch moglich sein.
- 7.) Feuerdisziplin! Gozioltes Fouer aller Waffen einschl. des Gewehres. Dazu Wendigkeit des Feuers aller Unterstuetzungs-waffen auf wirkungsvolle Schussentfernungen.
- 8.) Gobrauch der Mahkempfnittel. Handgranaten, Bajonett, Spaten.
  Pistelen!
- 9.) Ausbildung und Schulung der Unterfuehrer bis hinauf zu den Kompaniefuehrern. Hierzu unter anderem Planspiele im kleinsten Rahmen.
- 10.) Waffenausbildung an mocglichst violen Waffen einschl. Boutewaffen.
- 11.) Kraftishrausbildung.
- 12.) Exergionat nur zur Festigung der Manneszucht, nie ueber eine halbe Stunde.

Der Oberbefehlshaber:
I. V.

General der Panzer truppen

AGLIGITEL:

His zu den Divisionen

#### APPENDIX B 8<sup>th</sup> ARMY OPERATIONS ORDER FOR OPERATION LIGHTFOOT<sup>1</sup>

#### LIGHTFOOT

14 September 1942 General Plan of Eighth Army

#### **OBJECT**

1. To destroy the enemy forces now opposing Eighth Army. The operations will be designed to 'trap' the enemy in his present area and to destroy him there. Should small elements escape to the West, they will be pursued and dealt with later.

#### PLAN IN OUTLINE

- 2. The enemy will be attacked simultaneously on his North and South flanks.
- 3. The attack on the North flank will be carried out by 30 Corps with the object of breaking in to the enemy defences between the sea and inclusive the MITEIRIYA Ridge, and forming a bridgehead which will include all the enemy main defended positions and his main gun areas. The whole of this bridgehead will be thoroughly cleared of all enemy troops and guns. 10 Corps will be passed through this bridgehead to exploit success and complete the victory.
- 4. On the South flank, 13 Corps will:
  - a) Capture HIMEIMAT
  - b) Conduct operations from HIMEIMAT designed to draw enemy armour away from the main battle in the North.
  - c) Launch 4 Lt Armd Bde round the Southern flank to secure DABA and the enemy supply and maintenance organization at that place, and to deny to the enemy air the use of the air landing grounds in that area.

#### **30 CORPS OPERATIONS**

- 5. The break-in attack will be carried out in the moonlight and will be supported by a great weight of artillery fire. Zero hour will be after moonrise on D1 i.e. probably about 2200 hours. See para. 12.
- 6. The following troops will be available:
  - 9 Aust Div.
  - 51 (Highland) Div.
  - 23 Armd Bde.
  - 2 NZ Div (less such troops as are not required for the task allotted).
  - 1 SA Div.
- 7. The troops of NZ Div will be used to capture and hold the MITEIRIYA Ridge West of the QATARA track. These troops will return to command 10 Corps at a time to be arranged mutually between 10 Corps and 30 Corps.
  - 1 SA Division will swing forward its right to join up with NZ troops on the MITERIYA Ridge.
- 8. The attached tracing shows:
  - a) Objectives of 30 Corps.
  - b) Assembly area 10 Corps.
  - c) The two areas where gaps in the enemy minefield are to be made by 10 Corps.
  - d) Routes from 10 Corps assembly area forward to the battle area.
  - e) Deployment areas of armoured brigades of 10 Corps.
  - f) Subsequent areas to be occupied by 10 Corps. As to whether these precise areas are actually occupied will depend on the development of the battle.
- 9. It is essential to the success of the whole operation that leading armoured brigades of 10 Corps should be in the deployment areas (para. 8(e)) ready to fight at first light on D2. They must not become embroiled in local fighting on the early morning of D2 whilst moving in to their deployment areas.

As extracted from Monty, the Making of a General, 1887-1942, by Nigel Hamilton, ISBN 0-07-025805-8, McGraw-Hill Book Company, New York, 1981, pages 732-741. Author's note: this order was revised or "fragged" on 6 October 1942 as discussed in Section 5.1, but no written change seems to have been published.

Therefore, 30 Corps will ensure that the deployment areas and the routes to them are thoroughly cleared of all enemy troops and guns before the armoured brigades begin to move in to them.

- 10. Gaps in our own minefields will be cleared, marked, and lit by 30 Corps.
- 11. The successful result of the whole operation will depend on whether 30 Corps achieve success in the break-in attack, clear the bridgehead area, and hold securely the ground gained. A great deal will depend on the proper employment of the artillery. Up to about 400 guns will be available and the concentrated use of this great firepower should ensure success.

In order to make certain that the best use is made of the available artillery resources the [Corps Chief of Royal Artillery] 30 Corps will, for this attack, assume command of all the artillery in 30 Corps. Once the bridgehead area has been secured, artillery must reach out to deal with targets further afield and to assist in beating off counter-attacks.

12. 30 Corps will report the desired zero hour for the attack, consulting with 10 Corps. The ruling factor is as given in para. 9 above. A full moon will be assumed.

#### 10 CORPS OPERATIONS

- 13. See attached tracing referred to in para 8 above.
- 14. The operations of 30 Corps are so designed that 10 Corps can pass unopposed through gaps in the enemy minefields and be launched into territory West of these main minefields. 10 Corps will then pivot on the MITEIRIYA Ridge, held by its own NZ Division, and will swing it right round till the Corps is positioned on ground of its own choosing astride the enemy supply routes.

Further operations will depend on how the enemy re-acts to this initial thrust.

The aim in the development of the further operations will be based on:

- a) The enemy being forced to attack 10 Corps on the ground of its own choice.
- b) 10 Corps being able to attack the enemy armoured forces in flank.
- c) The fact that once the enemy armoured and mobile forces have been destroyed, or put out of action, the whole of the enemy army can be rounded up without any difficulty.
- 15. The move of 10 Corps to its assembly area will take place by night, the Corps being assembled by dawn on D1 day. Several nights will be used as may be decided by 10 Corps. See para 25(a).

The move forward from the assembly area to deployment areas will begin after dark on D1 day; see paras 9 and 12.

- 16. 10 Corps will be responsible for:
  - a) Marking and policing of its routes from the assembly area up to the gaps in the enemy
  - b) Clearing its own gaps in the enemy minefields. See para 8(c). CE Eighth Army will arrange for any additional RE assistance that may be required.
- 17. 30 Corps will be responsible for:
  - a) Construction of routes forward from 10 Corps assembly area up to the present forward positions.
  - b) AA protection for all gaps in minefields, including 10 Corps gaps in the enemy minefields.

#### 13 CORPS OPERATIONS

18. The task of 13 Corps is twofold:

First. To assist the main armoured battle in the North by drawing off enemy armour to the South.

Second. To launch a mobile and armoured force round the enemy's Southern flank to secure and hold the enemy supply base, maintenance organizations, and air landing grounds, in the DABA area.

- 19. For both tasks, and especially for the successful conduct of the first task, a secure base is essential. 13 Corps will therefore begin its operations by breaking into the enemy positions at or about HIMEIMAT. This attack will begin at the same time as the attack of 30 Corps; see para. 12.
- 20. Operations will then be so developed that 4 Light Armd Bde can be launched at first light on D2 to secure DABA vide [see] para 18.

It will be particularly important to destroy all enemy aircraft found on the ground at DAGA; also to deny the enemy the use of the landing grounds; holding them for our own use later on.

On arrival in the DABA area 4 Light Armd Bde will come directly under Army HQ.

21. Having launched 4 Light Armd Bde to Daba, 13 Corps will operate with 22 Armd Bde with the object of drawing enemy armour down to the South and away from the main battle area in the North.

All enemy MET, and transport generally in rear of the enemy positions in the South will be destroyed; enemy armoured divisions attack 10 Corps from the South will themselves be attacked from the rear by 22 Armd Bde.

The operations of 22 Armd Bde will be conducted with the greatest vigour and determination. But in order to ensure that Eighth Army is at all times properly balanced, and has no need to re-act to enemy thrusts, it is essential that 22 Armd Bde should not be destroyed by superior armoured forces; it must remain 'in being' on the Southern flank, operating as indicated above, until it is clear how the battle is going to swing; at the appropriate moment everything will be thrown into the fight by Army HQ in order to finish off the enemy.

#### SEA LANDING

22. A combined operation is being planned and organized with the object of landing a small force of tanks, artillery and infantry on the coast about RAS ABU EL GURUF.

This force, having landed, will operate Eastwards towards SIDI ABD EL RAHMAN and assist the operations of 30 Corps and 10 Corps.

The time of landing will be synchronized carefully with the main operations of the Eighth Army. This force will come directly under Army HQ.

#### AIR OPERATIONS

- 23. These are being developed on the following lines:
  - a) Heavy bombing of the enemy's main aerodromes during the September full moon period. No attack by our land forces will follow.
  - b) Heavy bombing of the enemy's main aerodromes during the October full moon period.
  - c) At zero hour on D1 day heavy bombing attacks of the enemy armoured formations. These will continue all night on a very heavy scale.

#### **DECEPTION MEASURES**

- 24. Every endeavour will be made to deceive the enemy as to our intentions to attack at all and, if this fails, as to the direction of our main attack.
- 25. Offensive intentions are usually given away by concentrations of transport, thereby implying concentration of troops and force for an attack. It is therefore essential that a certain normal density of vehicles should be decided for any area and that density be stabilised on 1 October and not altered after that date. This is vitally important in the following areas:
  - a) Assembly area of 10 Corps. This area must be made a general living area now, and arrangements made so that the number of vehicles in it by 1 October will be approximately the same as when 10 Corps is in the area during daylight hours on D1. Furthermore, the positions of the vehicles should be approximately those of the tanks and vehicles of 10 Corps will occupy on D1. On the nights before D1 the units of 10 Corps will move into the area, and the appropriate transport echelons now there will move out. For this scheme to be a success the most careful plans must be made by 30 Corps, and the most complete cooperation arranged between 10 Corps and 30 Corps.
  - b) Area of 9 Australian Division. This Division will require a certain amount of transport for use during exploitative towards SIDI RAHMAN. All other transport should be sent back.
  - c) Area of 51 (Highland) Division. This Division will require practically no transport, or very little. 30 Corps must ensure that when the Division moves in to its concentration area for attack, the density of transport remains unchanged.
  - d) Area of NZ Division (see para 7). This Division, with tanks co-operating, will capture and hold the MITEIRIYA Ridge, and later may be required for further mobile operations Westwards. A good deal of transport will be necessary.
  - e) Area of 1 SA Division. This Division will require practically no transport.
- 26. Orders will be issued by Army HQ regarding the camouflage and formation of dumps in the assembly areas and further forward. The camouflage will be erected first, before the dumps begin to form.
- 27. Orders regarding the movements, positioning, and handling of artillery in 30 Corps area will require very careful organization in order not to give away our intentions to the enemy, but rather to deceive him. Further detailed orders on this subject will be issued by Army HQ.
- 28. Work on tracks and routes forward from 10 Corps assembly area will be started now, work being confined to those places which take a long time to complete. See para. 17(a).

The remaining portions of the tracks will be finished off on the last two nights before D1 day.

It is not possible to camouflage long lengths of track, but much can be done by careful organization of work.

CE Eighth Army will co-ordinate all work in connection with the construction of tracks and routes forward. It is important that tracks forward should start at the Eastern end of 10 Corps assembly area.

#### **SECRECY**

29. It is impossible to over-stress the need for secrecy regarding operation 'LIGHTFOOT'.

Details of the operation will not be communicated below Div HQ, and at Div HQ no officer will be told anything about the operation except the CRA and GSO 1. All work in connection with preparations for the attack will be given to officers as part of their normal work, and they will not be told the reason for the work. Nothing will be written about the operation; all orders will be verbal for the present.

#### **TRAINING**

30. All formations and units will at once begin to train for the part they will play in this battle. Time is short and we must so direct our training that we shall be successful *in this particular battle*, neglecting other forms of training.

31. This battle will take place during the period of the full moon.

The initial break-in attack by 30 Corps, the initial operations by 13 Corps, and the move forward of 10 Corps to deployment areas will all be carried out by night with a full moon.

Therefore, full advantage must be taken of the September full moon period to practise operating on a moonlit night and actually to rehearse the operations concerned, using similar bits of ground.

32. There will be a great weight of artillery fire available for the break-in battle. During the training period, infantry and other arms must be accustomed to advancing under the close protection of artillery fire and mortar fire.

We must have realism in our training and use live ammunition in our exercises with troops, even if this should result in a few casualties. I will accept full responsibility for any casualties that may occur in this way.

- 33. The accurate fire of mortars will be of the greatest value in the break-in battle. No troops can stand up to sustained heavy and accurate artillery and mortar fire without suffering a certain loss of morale; low category troops will be definitely shaken by such fire, and can then be dealt with easily by our own attacking troops.
- 34. Tanks that are to work in close co-operation with infantry in this battle must actually train with that infantry from now onwards.
- 35. The individual soldier must be given practice so that he will reach a high degree of skill with the weapons he will use in battle.
- 36. Full use will be made of the model in preparation for this battle. Every formation headquarters and every unit should have a model of the ground over which it is to operate, and on this model all officers will be instructed in the stage-management of the battle.

Finally all NCOs and men will be shown on the model the part they will play in the battle.

As far as officers and NCOs are concerned the model will be any ordinary piece of ground; the actual place names must not be shown. As the day of attack approaches more information can be disclosed.

No information about our offensive intentions will be disclosed to any officer or other rank who has even the slightest chance of being taken prisoner in a raid; this order will not be relaxed until the morning of D1 day.

37. I direct the attention of Corps and Divisional Commanders to Eighth Army Training Memorandum No. 1 issued on 31 August 1942. The fundamentals outlined in that memorandum will govern the conduct of our battle operations, and will, therefore, form the basic background for all our training.

Battle drill must be highly developed, and a good system organized in every formation and unit.

Unless our standard of battle drill and operational discipline is on a very high level, we shall fight at a disadvantage.

#### **MORALE**

- 38. This battle for which we are preparing will be a real rough house and will involve a very great deal of hard fighting. If we are successful it will mean the end of the war in North Africa, apart from general 'clearing-up' operations; it will be the turning point of the whole war. Therefore, we can take no chances.
- 39. Morale is the big thing in war. We must raise the morale of our soldiery to the highest pitch; they must be made enthusiastic, and must enter this battle with their tails high in the air and with the will to win.

There must in fact be no weak links in our mental fitness.

40. But mental fitness will not stand up to the stress and strain of battle unless troops are also physically fit.

This battle may go on for many days and the final issue may well depend on which side can best last out and stand up to the buffeting, the ups and downs, and the continuous strain of hard battle fighting.

There will be no tip and run tactics in this battle; it will be a killing match; the German is a good soldier and the only way to beat him is to kill him in battle.

41. I am not convinced that our soldieries are really tough and hard. They are sun burnt and brown, and look very well; but they seldom move anywhere on foot and they have led a static life for many weeks.

During the next month, therefore, it is essential to make our officers and men really fit; ordinary fitness is not enough, they must be made tough and hard.

42. This memorandum will not be reproduced or copied. It will form the basis of all our plans and preparations for operation 'LIGHTFOOT'.

#### APPENDIX C 8<sup>th</sup> ARMY OPERATIONS ORDER FOR OPERATION SUPERCHARGE<sup>1</sup>

#### OPERATION SUPERCHARGE EIGHTH ARMY PLAN

MOST SECRET 20 Oct 1942

- 1. Operation SUPERCHARGE will take place on night 31 Oct/1 Nov. The operation is designed to:
  - (a) Destroy the enemy armoured forces.
  - (b) Force the enemy to fight in the open, and thus make him use petrol by constant and continuous movement.
  - (c) Get astride the enemy supply route, and prevent movement of supply services.
  - (d) Force the enemy from his forward landing grounds and aerodromes.
  - (e) Bring about the disintegration of the whole enemy army by a combination of (a), (b), (c) and (d).

#### 30 CORPS TASK

- 2. To attack by night from the present forward positions between the 297 and 301 Northing grids. Attack to penetrate Westwards to a depth of 4000 yds.
- 3. On reaching the final objective, armoured and infantry patrols to push out farther to the West so as to cover the debouchment of the armoured divisions and so enable them to get out and deploy the more easily.
- 4. The flanks of the penetration to be held securely, and their Eastern extremities to be linked up firmly with our existing positions.
- 5. The whole area of penetration to be cleared, and organised for free movement, and to be held securely as a firm base from which to develop offensive operations.

#### 10 CORPS OPERATIONS

- 6. 10 Corps will break out into the open through the penetration made by 30 Corps.
- 7. Armoured cars, at least two regiments initially, will be launched through the bridgehead area before daylight on 1<sup>st</sup> November and will push out to the N.W., the West, the S.W., and the South.

The task of the armoured cars will be to operate offensively on the enemy supply routes, destroy everything they meet, and prevent any supplies or reinforcements from coming forward, and prevent any movement from the forward areas to the rear.

Armoured cars must be prepared to operate on their own for some days, keeping up the stranglehold and making full use of enemy petrol and supplies.

- 8. 10 Corps will secure as a first objective the general area Pt 46 in 858299 Tell el Aqqaqir in 860297. Operations will then be developed so as to:
  - (a) Destroy the enemy armoured forces.
  - (b) Bring about the complete disintegration of the enemy's rear areas.
- 9. The general axis of operations for 10 Corps, subject to the fulfillment of the task given in para. 8(a) will be N.W. towards Ghazal Station, so as to get in behind the enemy forces in the Sidi Rahman area and cut them off.
- 10. The forward movement of 10 Corps will be timed so that the area of the first objective is secured before daylight on 1<sup>st</sup> November, and operations developed from that area as the sun is rising.
- 11. It will be clearly understood that should 30 Corps not succeed in reaching the final objective vide paras. 2 and 3, the armoured divisions of 10 Corps will fight their way to the first objective.

#### 10 AND 30 CORPS

12. 30 Corps will hold N.Z. Div. in readiness to take over the area of 10 Corps first objective vide para. 8, so as to free 10 Corps for offensive operations against the enemy armoured formations or for a N.W. movement towards Ghazal Station.

<sup>&</sup>lt;sup>1</sup> As extracted from The Memoirs of Field-Marshal the Viscount Montgomery of Alamein, K.G., by Sir Bernard Law Montgomery, The World Publishing Company, New York, 1958, pages 121-123.

- 13. Very close touch, co-operation, and liaison will be required between 10 Corps and 30 Corps throughout the whole operation.
- 14. This operation if successful will result in the complete disintegration of the enemy and will lead to his final destruction.

It will therefore be successful.

Determined leadership will be vital; complete faith in the plan and its success, will be vital; there must be no doubters; risk must be accepted freely; there must be no "bellyaching."

I call on every commander to carry through this operation with determination, to fight their formations bravely, and to instill optimism and offensive eagerness into all ranks.

SUPERCHARGE will win for us the victory.

#### 13 CORPS

- 15. 13 Corps will do what is possible on the Southern flank before or after dark on 31<sup>st</sup> October to make the enemy think an attack is coming on that flank.
- 16. The corps will be ready to take immediate action the moment it appears that the enemy is beginning to crack.

#### ARMY RESERVES

17. 7<sup>th</sup> Arm. Div. (less 4<sup>th</sup> Lt. Army. Brigade).

131st Inf. Bde. (Queens).

These two formations will be held in Army reserve ready for use as the situation develops.

#### R.A.F. OPERATIONS

18. The R.A.F. are playing a great part in inflicting moral and material damage on the enemy. This is being intensified, from tomorrow inclusive onwards, and will reach its culminating point as SUPERCHARGE is launched.

#### **FINALLY**

19. We know from all sources of intelligence that the enemy is in a bad way, and his situation is critical. The continued offensive operations of Eighth Army and the R.A.F. have reduced him to such a state that a hard blow *now* will complete his overthrow.

The first stage in the blow is the operation being staged by 9<sup>th</sup> Aus. Div. tonight on the North flank; success in this operation will have excellent repercussions on SUPERCHARGE.

SUPERCHARGE itself, tomorrow night 31st October/1st November, will be the second blow and a staggering one, and one from which I do not consider he will be able to recover.

#### 

The Italian officers and their men were unready, their tanks too weak, their artillery unable to fire beyond five miles. Italian troops had no field kitchens and were frequently begging food and drink from their German comrades. "They're useless except for defense, and even then they're useless if the British infantry attacks with fixed bayonets." "The ordinary Italian soldiers are good, their officers are worthless." "The Italian troops have failed once more exactly as during the last offensive. The reasons for this are as follows: the command is not equal to the mobile direction of battle in desert warfare... The training of Italian units does not correspond to the demands of a modern war. For example, units brought up to replace lost battalions for a division fired for the first time near the front. Officers who had not served since the end of World War I were detailed as battalion commanders. The arms of Italian units do not permit the Italian soldier to withstand British attacks without German assistance. Apart from the well-known faults of Italian tanks – short range and feeble engines – the artillery, with its lack of mobility and inadequate range (6km - maximum 8km), is absolutely inferior to the British artillery, which is known to be good. Also weak equipment with antitank weapons gives the Italian soldier a feeling of inferiority. Supply of the Italian troops is not adequate. Troops have no field kitchen and quantities of food are small. For this reason, the Italian soldiers, who are usually extremely contented and unassuming, often come to their German comrades to beg something to eat and drink. The great difference in food allocation to officers and men has an adverse effect on morale of the troops. The Italian soldier is not equal to the bayonet attacks of the British infantry. He has not got the nerve to hold on when enemy tanks have broken through. Continual bombing attacks and artillery fire quickly wear down his will to resist. The Italian soldier can maintain defense only with German support, and then only if the German soldier bears the brunt of the fighting."

Air Historical Branch Translations of Captured Documents (New Zealand), as sited in <u>Rommel, A Narrative and Pictorial History</u>, by Richard D. Law and Craig W. H. Luther, ISBN 0-912138-20-3, R. James Bender Publishing, San Jose, California, 1980, footnote 38 on page 179. #### APPENDIX E

#### "Sperrplan el Alamein"

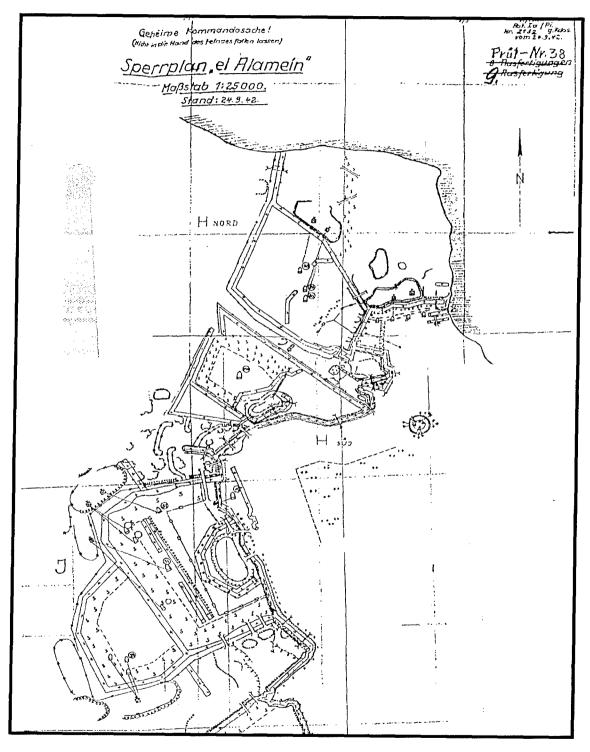

#### AXIS OBSTACLE PLAN AS OF 24 SEPETEMBER 1942

- Annex 1. "Sperrplan el Alamein"
- Annex 2. Italian Obstacle Overview
- Annex 3. Detailed Obstacle plan for the 2<sup>nd</sup> New Zealand Division Zone of Attack
  - a) Overview of Mine Box K and L
  - b) Early Mining Efforts in the Vicinity of Mine Box K and L
  - c) Detailed Mine Sheet (Blätter) for Mine Box K

  - d) Detailed Mine Sheet (*Blätter*) for Mine Box L
     e) Later Mining Activity in the 2<sup>nd</sup> New Zealand Division Zone

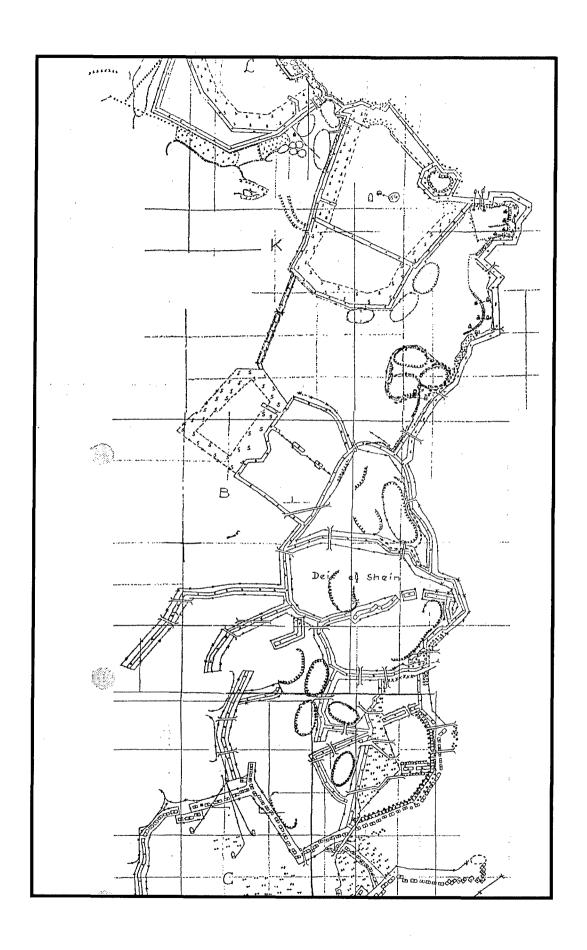

Annex 4. World War II German Military Symbology

Appendix E, Annex 1. "Sperrplan el Alamein" As of 24 September 1942

Note: See page E-4 for the legend to this map

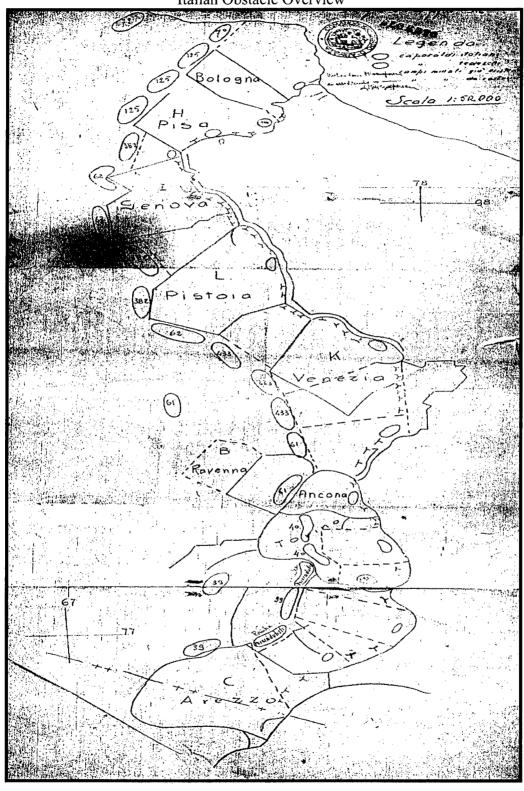

<sup>&</sup>lt;sup>i</sup> US National Archives, Captured German Records Division, Series T-313, Roll 432, beginning on frame 8.724.578.

### Legend to "Sperrplan el Alamein"

Graphic	German Legend to Sperrp	English Translation
1	Panzer Dichtminenfeld	Tactical minefield composed only of anti-tank mines
	Ungefähre Lage geplanter Minenfelder	Approximate position of a planned minefield
++ ++	Panzer Streuminen	Randomly emplaced anti-tank mines
222	Scheinminenfeld	Dummy minefield
Bo ∩ a p a p n	S-Minen	S-mines
-0-0-	Spanndrahtminen	Tripwire-fuzed mines
+	Beobachten-Minen	Command-detonated mines
$\mathfrak{Q}_{\overline{\mathbf{o}}}$	Fliegerbomben (# Stück)	Aircraft bombs rigged as mines (# placed)
#	Zündstelle für Beobachten-Minen	Firing point for command-detonated mines
	Zündleitung oder Zünddraht	Firing train or firing wire
भागा	S-Rollen (einfach)	Barbed wire concertina (single coil)
क्रम २०३१ <sup>.</sup>	S-Rollen (zweifach)	Barbed wire concertina (double coil)
2000	S-Rollen (dreifach)	Barbed wire concertina (triple coil)
	Offene Gasse	Open lane
	Geheime Gasse	Secret lane
>	Spähtruppegasse	Reconnaissance patrol lane
	Lage des Sperrtrupps für Schließung der Gassen	Position of troops responsible for closing the lanes
	Drahtzaun	Barbed wire fence
*****	Flanderzaun	double apron fence
-0-0-	Steinhaufen und Kanisterbegrenzung	Pile of rocks or canisters to mark minefields
	Versteckte Ladungen	Hidden charges (booby traps)
	Ausgebauter Stützpunkt	Prepared strongpoint
	Noch nicht fertig ausgebauter Stützpunkt	Strongpoint under construction

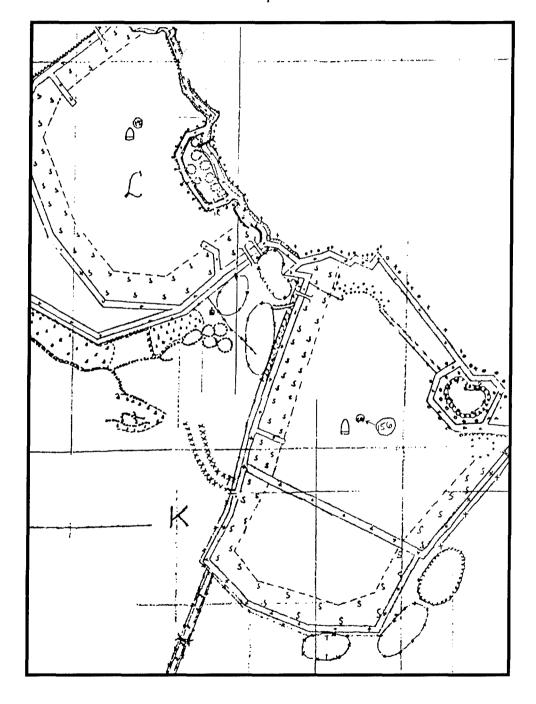

Appendix E, Annex 2. Italian Obstacle Overview<sup>ii</sup>

ii This overlay is included primarily because it gives the names the Italians used for the various mine boxes (which appear in the narrative), along with their German letter designator. Also, this map provides a useful overview without being too "busy." US National Archives, Captured German Records Division, Series T-313, Roll 467, frame illegible.

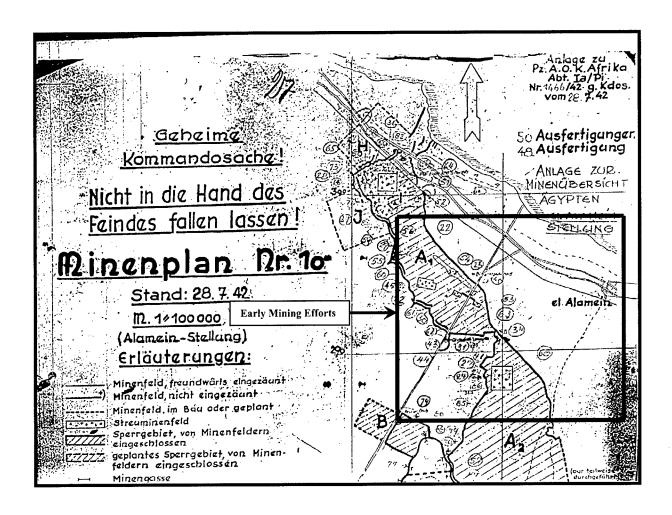

## Appendix E, Annex 3. Detailed Obstacle Plans for the 2<sup>nd</sup> New Zealand Division Zone of Attack

Appendix E, Annex 3a Overview of Mine Boxes K and L<sup>iii</sup> As of 24 September 1942

iii Included to help orient the reader. The engineers of the panzerarmee significantly modified the area between mine boxes K and L between 24 September and 23 October (the beginning of Operation 'Lightfoot'), see Annex 3e. In this overlay, Mine Box L is to the top left, while Mine Box K is to the bottom right of the page. US National Archives, Captured German Records Division, Series T-313, Roll 432, frame 8,724,585.

## Appendix E, Annex 3b. Early Mining Efforts in the Vicinity of Mine Boxes K and $L^{iv}$

iv "Minenplan Nr. 10," Anlage zu Pz. A.O.K. Afrika, Abt. Ia/Pi, Nr. 1466/42 g. Kdos, vom 28.7.42 (28 July 1942), US National Archives, Captured German Records Division, Series T-313, Roll 432, frame 8,724,838. See also "Minenübersicht Ägypten. El Alamein-Stellung. Vom 10.7.1942 bis 31 August 1942." US National Archives, Captured German Records Division, Series T-313, Roll 432, frames 8,724,840 to 8,724,854.

<u>Forward of Mine Boxes K and L</u> (The numbers below correspond to the circled numbers found in the highlighted box on *Minenplan Nr. 10* on page E-7. These numbers are in Obstacle Zone A1 from South to North)

- 53. The 2<sup>nd</sup> Company of the 900<sup>th</sup> Pioneer Battalion reported on 25 July 1942 that they had laid 200 mines between the Italian III Battalion, 62<sup>nd</sup> Infantry Regiment and III Battalion, 61<sup>st</sup> Infantry Regiment in an area 1600 wide and 800 meters deep.
- 5. The 1<sup>st</sup> Company of the 900<sup>th</sup> Pioneer Battalion reported on 15 July 1942 that they had laid a "*Minenriegel vor Kasta Briehl*" of 2419 English mines.
- 40. The 3<sup>rd</sup> Company of the 220<sup>th</sup> Pioneer Battalion reported on 24 July 1942 that they had randomly laid (*streueinsatz*) 150 mines to the left and right of the *Steinpiste* road in this area.
- 23. The 2<sup>nd</sup> Company of the 900<sup>th</sup> Pioneer Battalion reported on 20 July 1942 that they had laid 100 English mines along a 300 meter frontage in this area.
- 54. The 2<sup>nd</sup> Company of the 900<sup>th</sup> Pioneer Battalion reported on 25 July 1942 that they had randomly laid (*streuminen*) 180 mines 2 kilometers north of *Stutzpunkt* 1/361.
- 22. The 2<sup>nd</sup> Company of the 900<sup>th</sup> Pioneer Battalion reported on 20 July 1942 that they had randomly laid 1800 mines (*streuminen*) between the railroad embankment and *Kampfstaffel Kiel*. (Based on this description from the German records and as marked on "*Minenplan Nr. 10*", this minefield appears to overlap both Mine Box L and Mine Box J.)
- 56. The 7<sup>th</sup> Bersaglieri of the Italian XXI Corps reported on 25 July 1942 that they had emplaced 1900 mines in this area. (As marked on "*Minenplan Nr. 10*", this minefield appears to overlap both Mine Box L and Mine Box J.)

Along the Forward Edge of Mine Box K (The numbers below correspond to the circled numbers found in the highlighted box on *Minenplan Nr. 10* on page E-7. These numbers are from Southeast to Northwest)

- 31. The Italian III Battalion, 61<sup>st</sup> Infantry Regiment of the XXI Corps reported on 22 July 1942 that they had laid 850 mines at a density of 1 mine per meter of at this location.
- 43. The Italian II and III battalions, 62<sup>nd</sup> Infantry Regiment of the XXI Corps reported on 24 July 1942 that they had laid 750 mines to close a gap at this location.
- 62. On 26 July 1942, the Engineer Command of the Italian XXI Corps reported that III Battalion, 62<sup>nd</sup> Infantry Regiment had laid 600 mines at this location.
- 30. The Italian II Battalion, 62<sup>nd</sup> Infantry Regiment of the XXI Corps reported on 22 July 1942 that they had laid 1,000 mines at a density of 1 mine per meter at this location.
- 61. On 26 July 1942, the Engineer Command of the Italian XXI Corps reported that II Battalion, 62<sup>nd</sup> Infantry Regiment had laid 300 mines at this location. (As marked on "Minenplan Nr. 10", this minefield appears to overlap both Mine Box K and Mine Box L.)
- 44. The Italian II Battalion, 62<sup>nd</sup> Infantry Regiment and I Battalion, 61<sup>st</sup> Infantry Regiment of the XXI Corps reported on 24 July 1942 that they had laid 800 mines to complete the minefield at this location. (As marked on "Minenplan Nr. 10", this minefield may have actually been within Mine Box K.)

Along the Forward Edge of Mine Box L (The numbers below correspond to the circled numbers found in the highlighted box on *Minenplan Nr. 10* on page E-7. These numbers are from Southeast to Northwest)

- 61. On 26 July 1942, the Engineer Command of the Italian XXI Corps reported that II Battalion, 62<sup>nd</sup> Infantry Regiment had laid 300 mines at this location. (As marked on "Minenplan Nr. 10", this minefield appears to overlap both Mine Box K and Mine Box L.)
- 72. The 2<sup>nd</sup> Company of the 900<sup>th</sup> Pioneer Battalion reported on 27 July 1942 that they had randomly laid 250 mines (*streuminen*) in the vicinity of the German I Battalion, 155<sup>th</sup> Infantry Regiment.
- 45. The Italian II Battalion, 61<sup>st</sup> Infantry Regiment of the XXI Corps reported on 24 July 1942 that they had laid 700 mines to protect their left flank at this location.
- 60. On 26 July 1942, the Engineer Command of the Italian XXI Corps reported that the II Battalion, 61<sup>st</sup> Infantry Regiment had laid 900 mines at this location.
- 55. On 25 July 1942, the Italian XXI Corps reported that I Battalion, 62<sup>nd</sup> Infantry Regiment and II Battalion, 61<sup>st</sup> Infantry Regiment had laid 500 mines at this location.

<del>-</del>	

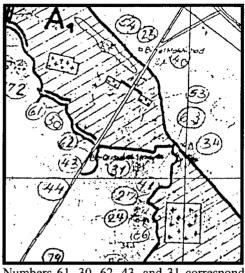

For the period between 11 and 22 August 1942, *Oberleutnant* Junkersdorf of 1<sup>st</sup> Company, 220<sup>th</sup> Pioneer Battalion reported that the work completed in Mine Box K included the emplacement of 7533 mines (1233 Tellermines, 2092 French mines, 3956 Egyptian mines, and 252 English mines), laid at a density of 1 mine per meter (except in the minefields reported on *Blätter* 12 and 13, where the mines were laid at 1 mine per 2 meters). Presumably, all anti-tank mines. In addition, he notes that within Mine Box K aircraft bombs had been emplaced as mines (31 on 16 August and 16 on 25 August, with 156 bombs as of 24 September 1942 according to Appendix E, Annex 3a) controlled from 63 firing points. These bombs were fuzed with tellermines, tripwires, or controlled with pull firing devices. *Oberleutnant* Junkersdorf does not include the mines covered in "Early Mining Efforts in the Vicinity of Mine Boxes K and L" (Appendix E, Annex 3b) in this report. In this same report, *Oberleutnant* Junkersdorf noted that these minefields were marked with a high barbed wire fence with iron stakes on the friendly side.

This overview of Mine Box K (on page E-11) shows the arrangement of the related "Blätter" (literally leaves or sheets) within this mine box. "Blätter" 1, 2, 11-13, I, and II were in the 1<sup>st</sup> South African Division zone of attack. US National Archives, Captured German Records Division, Series T-313, Roll 430, frames 8,723,323 to 8,723,346 or in "Historical Minefield Database (El Alamein)," by William Schneck and Fred Clodfelter, CD-ROM, 1998. The reader should be aware of the north arrow on each Blatt. Most of the time, North is not at the top of the page. The summary by Oberleutnant Junkersdorf is at Frame 8,723,324.

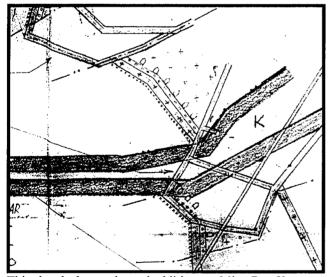

#### OVERVIEW OF MINE BOX Kvi

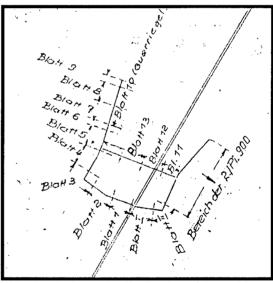

Overview of Mine Box K as of 22 September 1942

Numbers 61, 30, 62, 43, and 31 correspond roughly with the northeastern edge of Mine Box K

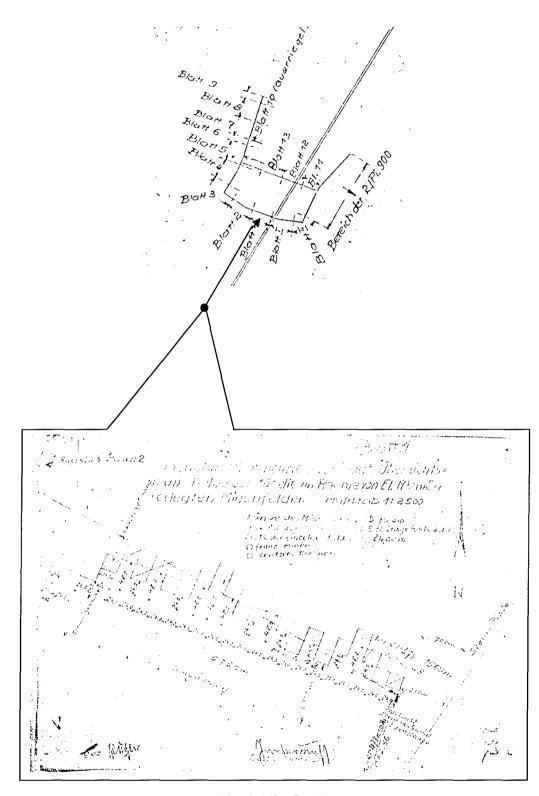

This sketch shows planned additions to Mine Box K (Command detonated aircraft bombs, S-mines, etc.) and the minefield that was placed between mines boxes K and L as of 6 October 1942

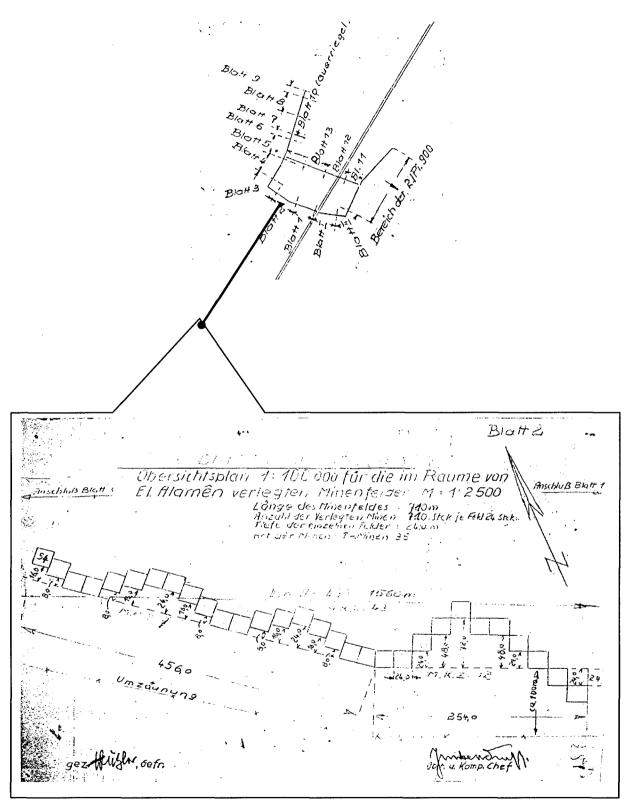

This sketch shows the distribution of the various blatt within Mine box K

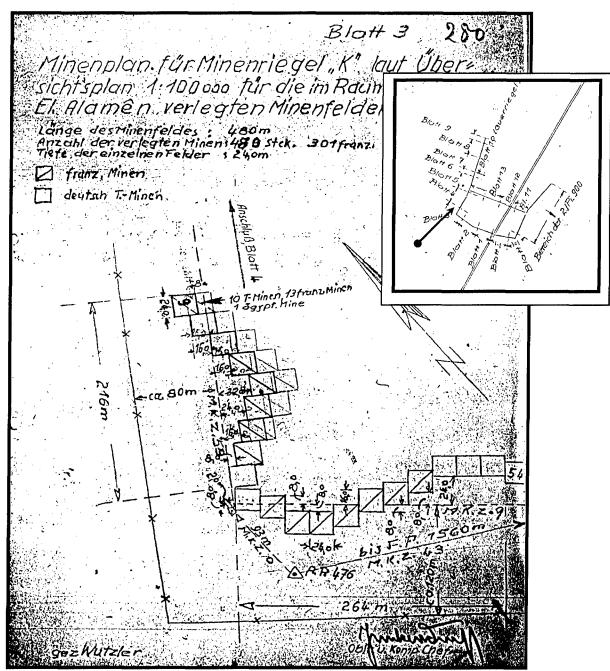

vi This illustration depicts relationship between Mine Box K and its individual minefields (as depicted on the subsequent *Blätter*) as well as previous (numbers 31, 43, 62, 30, 61, and 44 on the plan to the top right) and later mining efforts (as discussed later in Appendix E, Annex 3e). It also shows the relationship between Mine Box K and the overall obstacle plan.

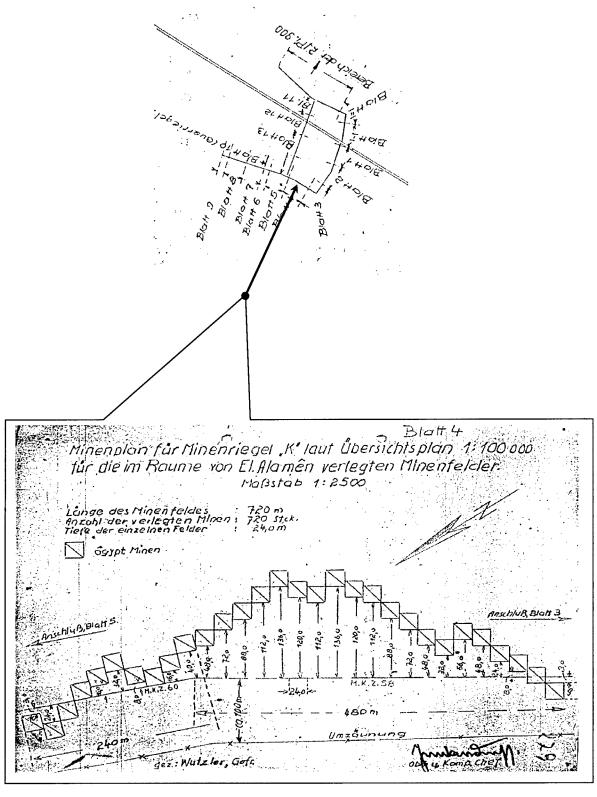

Blatt 1, Mine Box K

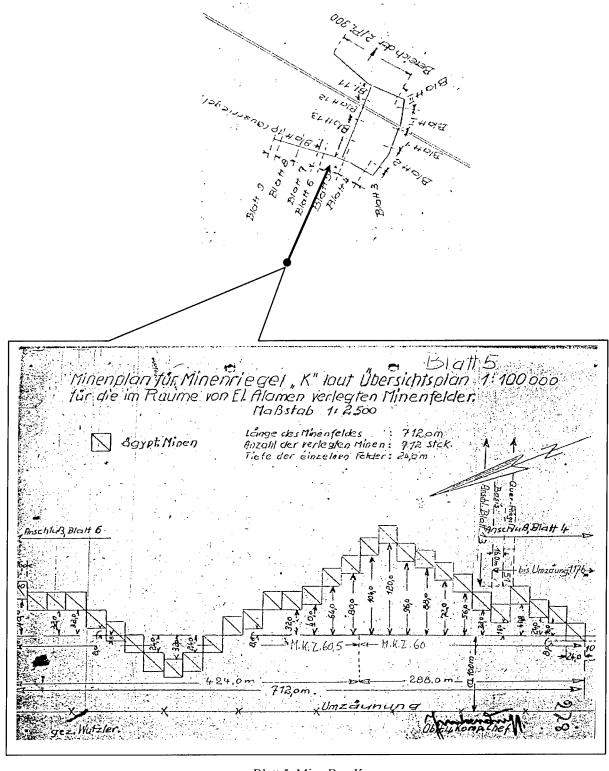

Blatt 2, Mine Box K

Blatt 3, Mine Box K

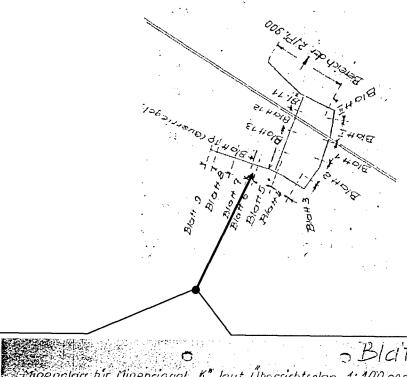

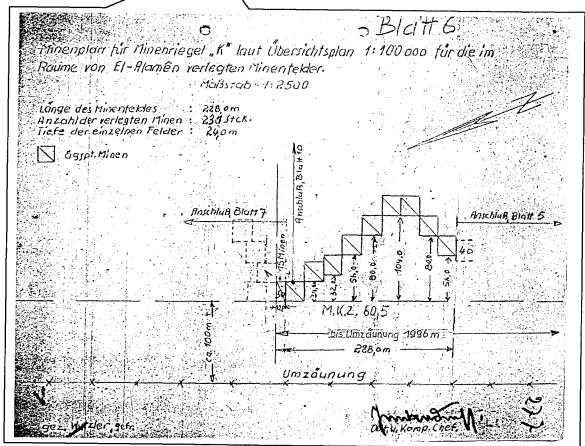

Blatt 4, Mine Box K

Blatt 5, Mine Box K

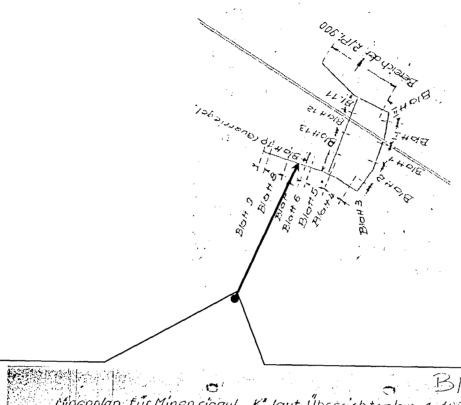

Note: Blatt 13 (page E-24) also adjoins Blatt 5 near its southern end.

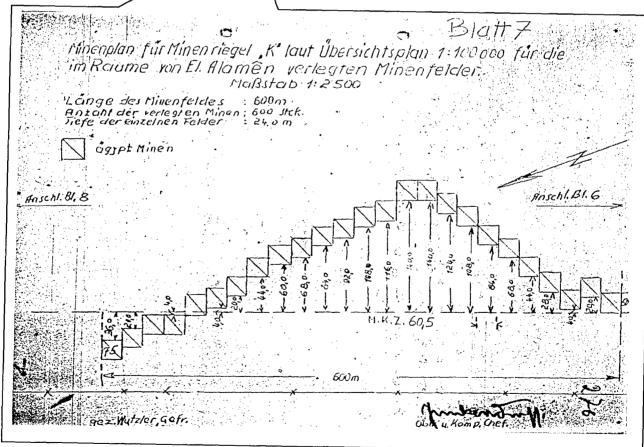

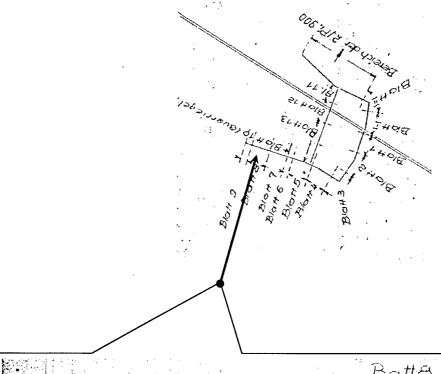

Blatt 6, Mine Box K

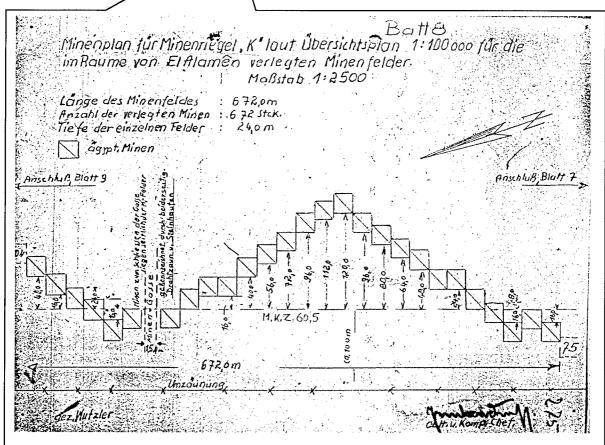

Note: Blatt 10 (page E-21) also adjoins Blatt 6 on its northern end.

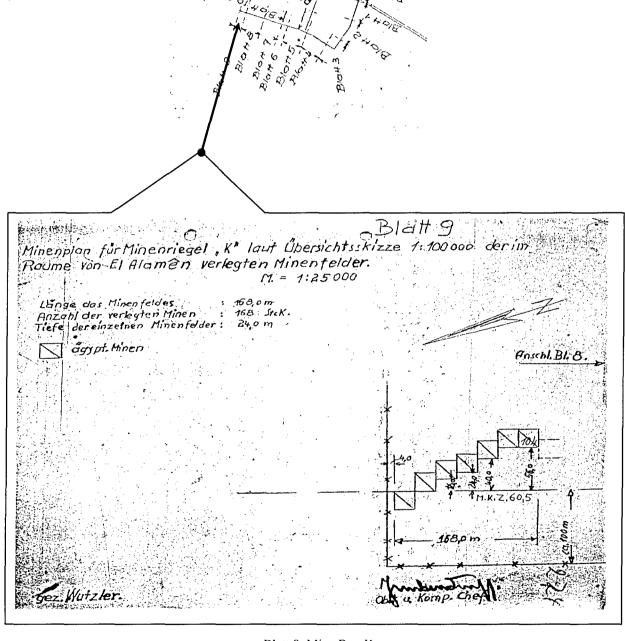

Blatt 7, Mine Box K

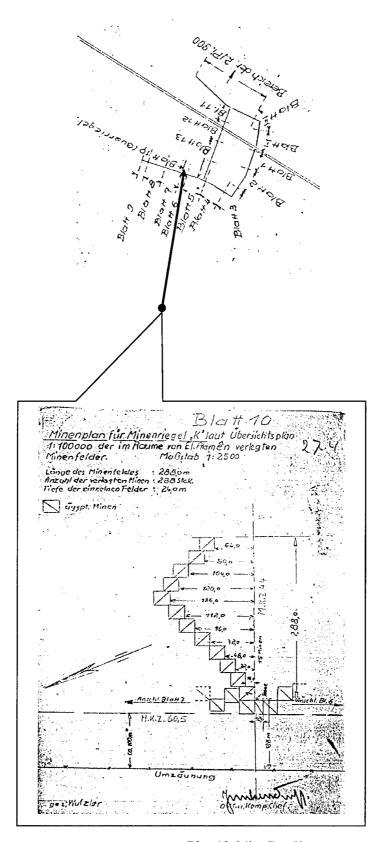

Blatt 8, Mine Box K

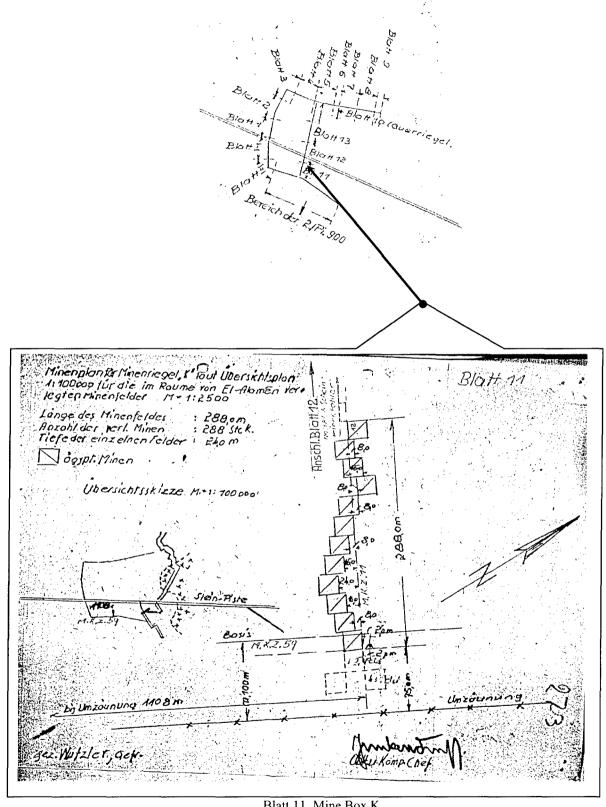

Blatt 9, Mine Box K

Note: No reference is made to tying in with the older Italian-laid minefields (most likely number 61 on Minenplan Nr. 10, page E-7) which ran along the forward (northeast) edge of Mine Box K

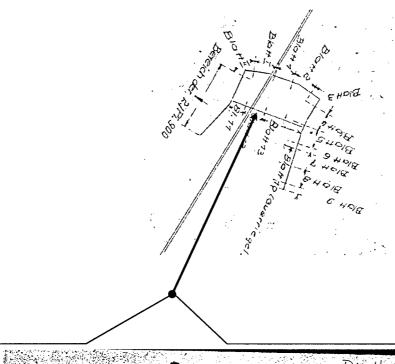

Blatt 10, Mine Box K

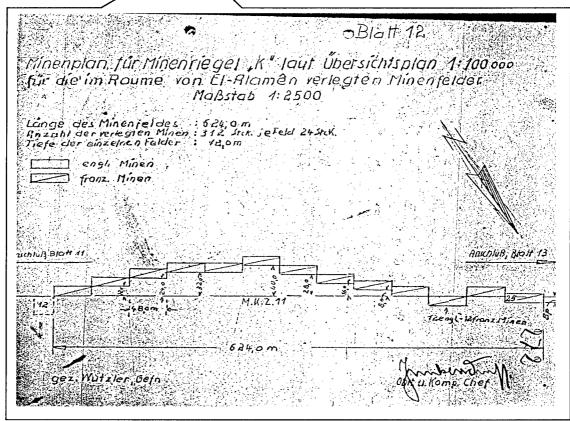

Note: This blatt adjoins to Blatt 6 (page E-17) on its western end.

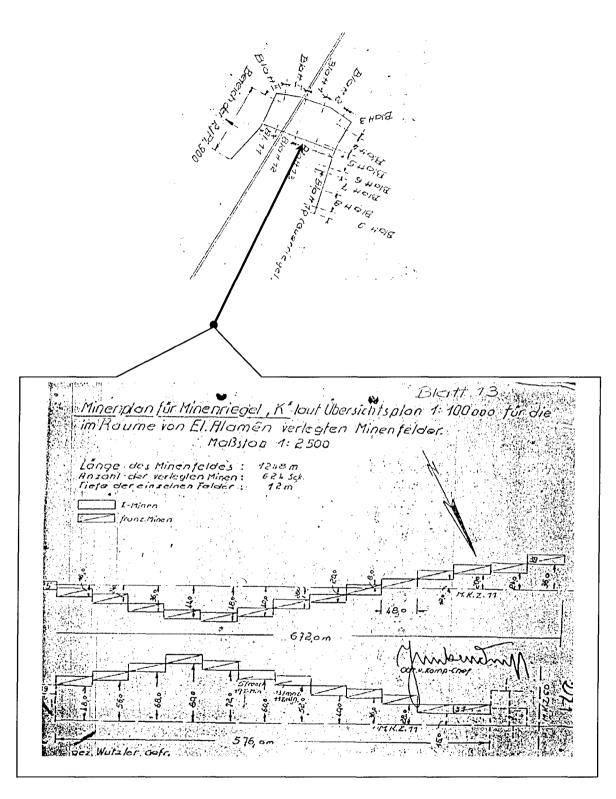

Blatt 11, Mine Box K

Note: On its eastern end, this blatt adjoins with Minenriegel "A" emplaced by 2<sup>nd</sup> Company, 900<sup>th</sup> Pioneer Battalion (see page E-28).

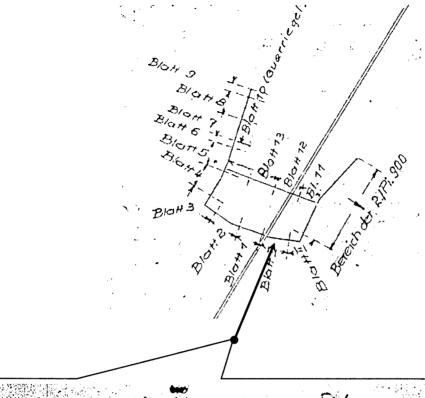

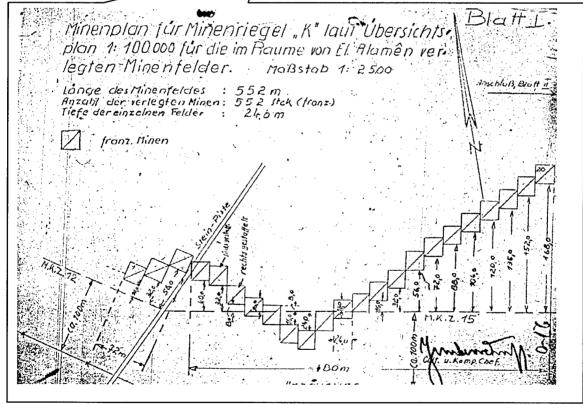

Blatt 12, Mine Box K

Blatt 13, Mine Box K

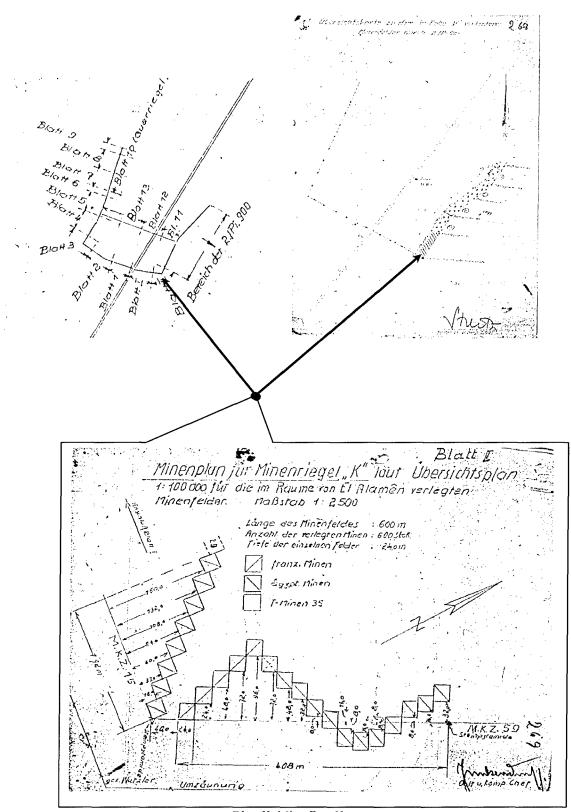

Note: The left (castern) end of the top row of mine panels in this blatt adjoins Blatt 12, while the right (western) end adjoins with the left (castern) end of the bottom row of mine panels. Finally, the right (western) end of the bottom row of mine panels adjoins with Blatt 5, Mine Box K (page E-11).

Blatt I, Mine Box K

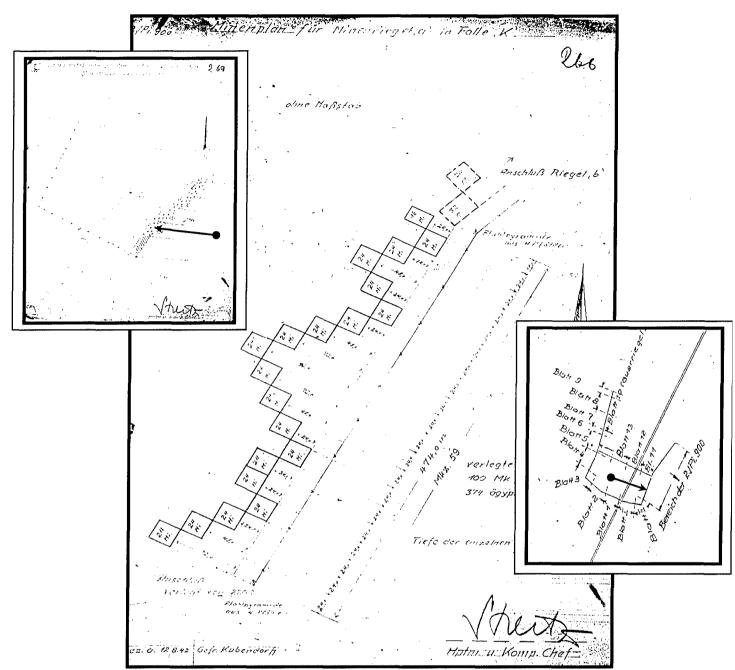

Note: The western end of this blatt adjoins with Blatt 1, Mine Box K (page E-12)

Blatt II, Mine Box K

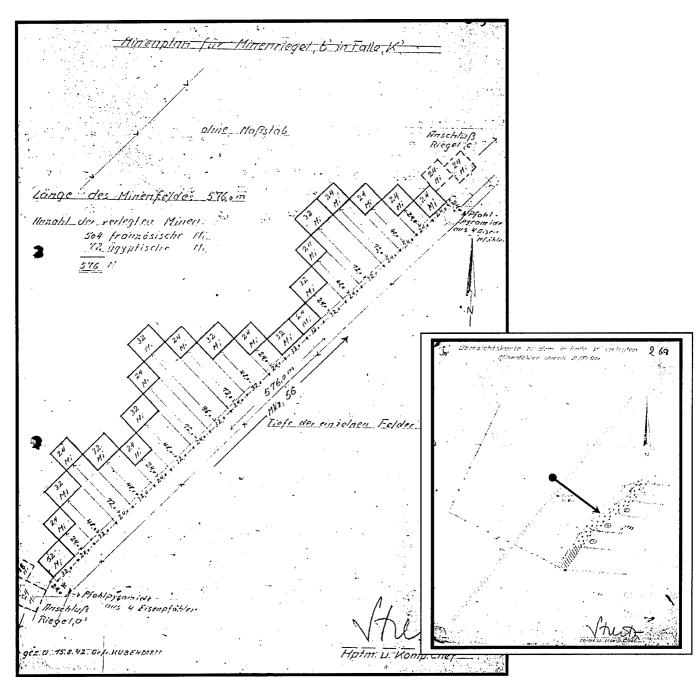

Note: The northern end of this blatt adjoins the southern end of Minenriegel "A" emplaced by  $2^{nd}$  Company,  $900^{th}$  Pioneer Battalion (see page E-28).

On 28 and 30 August 1942, *Gefreiter* Ulbricht of the 2<sup>nd</sup> Company, 900<sup>th</sup> Pioneer Battalion reported on the work thus far completed in Mine Box L. He noted that they had emplaced a total of 10,424 mines (5864 French mines, 2742 Egyptian mines, and 1818 English mines (marks II – IV), presumably all anti-tank mines) at a density of 1 mine per meter and covering a frontage of 10,590 meters. This does not include the mines covered in "Early Mining Efforts in the Vicinity of Mine Boxes K and L" (Appendix E, Annex 3b). In the same reports, *Gefreiter* Ulbricht noted the emplacement of 11,150 meters of barbed wire fence in Mine Box L. In addition, the records of the panzerarmee pioneer commander, Oberst Hecker, note that within Mine Box L the 220<sup>th</sup> Pioneer Battalion had emplaced 279 aircraft bombs as mines (202 in August, followed by 77 more in September).

vii This overview of Mine Box L (on page E-33) shows the arrangement of the related "Blätter" (literally leaves or sheets) within this mine box. "Blätter" 4-6, 10, and 11 were in the 51" Highland Division zone of attack. US National Archives, Captured German Records Division, Series T-313, Roll 430, frames 8,723,355 to 8,723,372, or in "Historical Minefield Database (El Alamein)," by William Schneck and Fred Clodfelter, CD-ROM, 1998. The reader should be aware of the north arrow on each Blatt. Most of the time, North is <u>not</u> at the top of the page. The summaries prepared by Gefreiter Ulbricht at frames 8,723,355 and 8,723,364 contain arithmetic and/or transcription errors. The numbers given on this page are taken directly from the individual Blätter.

## OVERVIEW OF MINE BOX Lviii

This illustration depicts relationship between Mine Box L and its individual minefields (as depicted on the subsequent *Blätter*) as well as previous and later mining efforts (as discussed later in Appendix E, Annex 3e). It also shows the relationship between Mine Box L and the overall obstacle plan.

Blatt 6, Mine Box L

Note: The right (north) end of the top row adjoins with the left (southern) end of the bottom row. The Italian minefield at the right (north) end of the bottom row is most likely number 55 or 61 from Minenplan Nr. 10, page E-7). Also note that Blatt 13 (page E-48) is located to the east of Blatt 6.

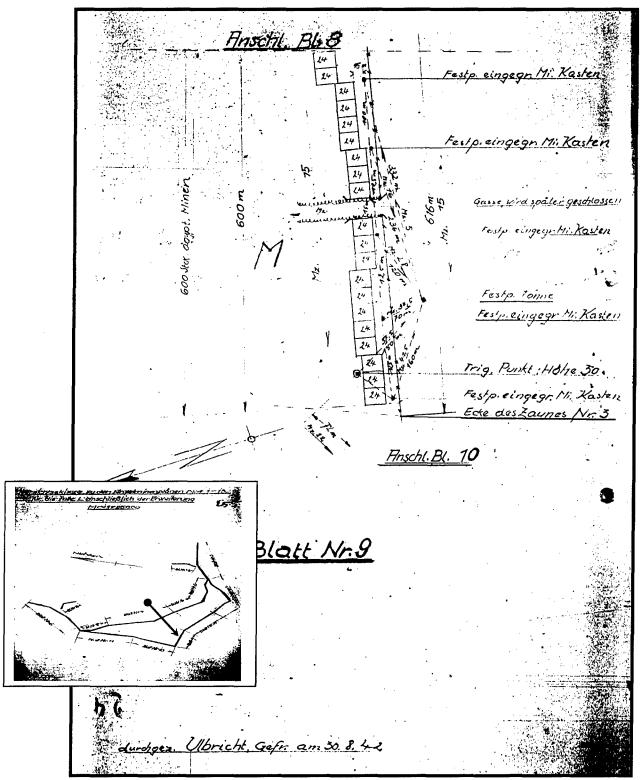

Blatt 7, Mine Box L

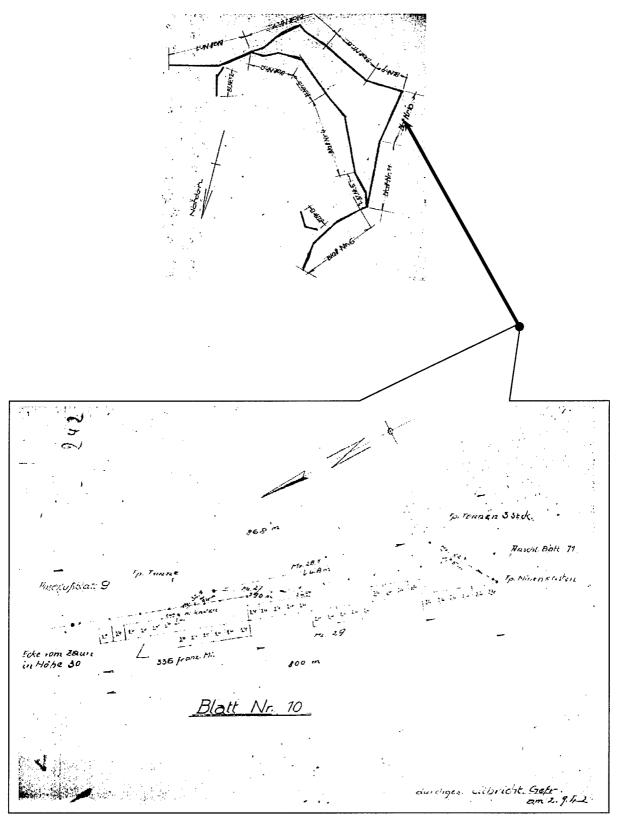

Note: The east end of Blatt 7 adjoins Blätter 1 and 2 (pages E-36 and E-37, respectively).

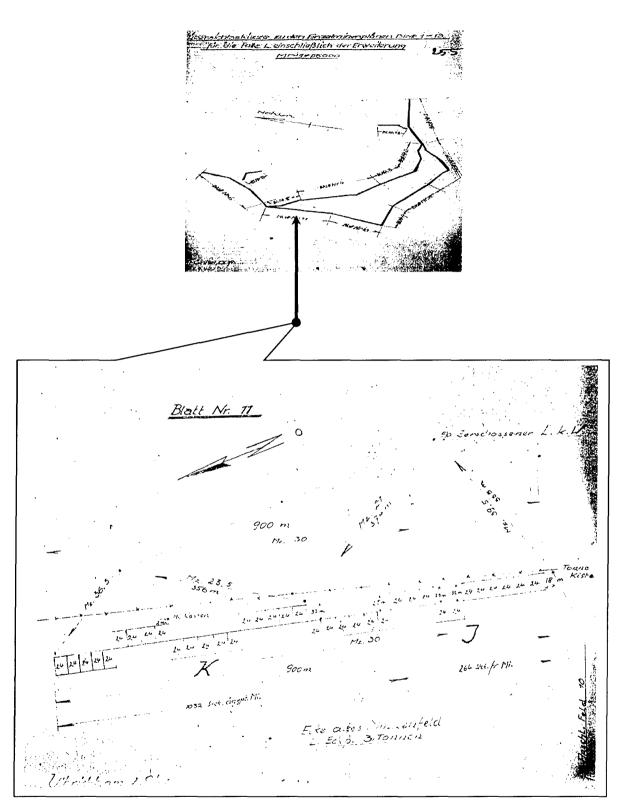

Blatt 8, Mine Box L

Blatt 9, Mine Box L

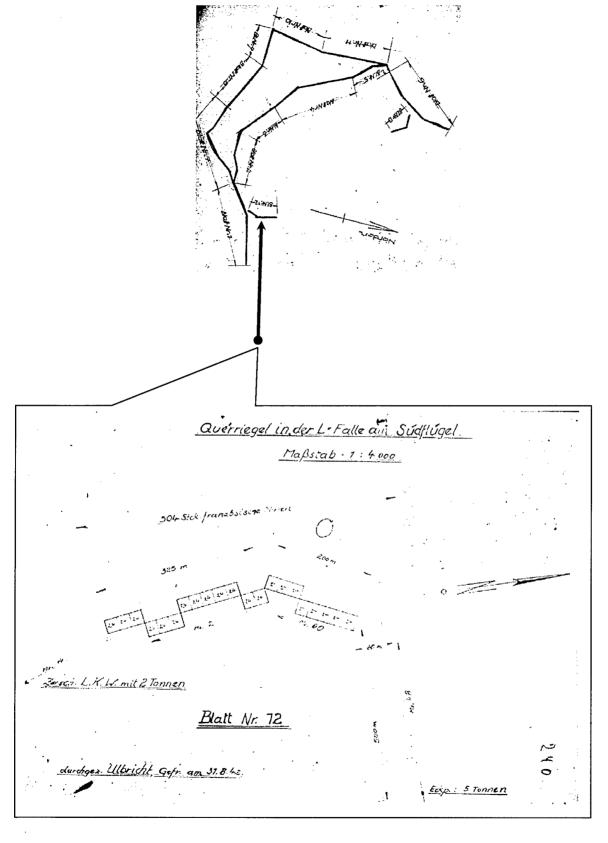

Blatt 10, Mine Box L

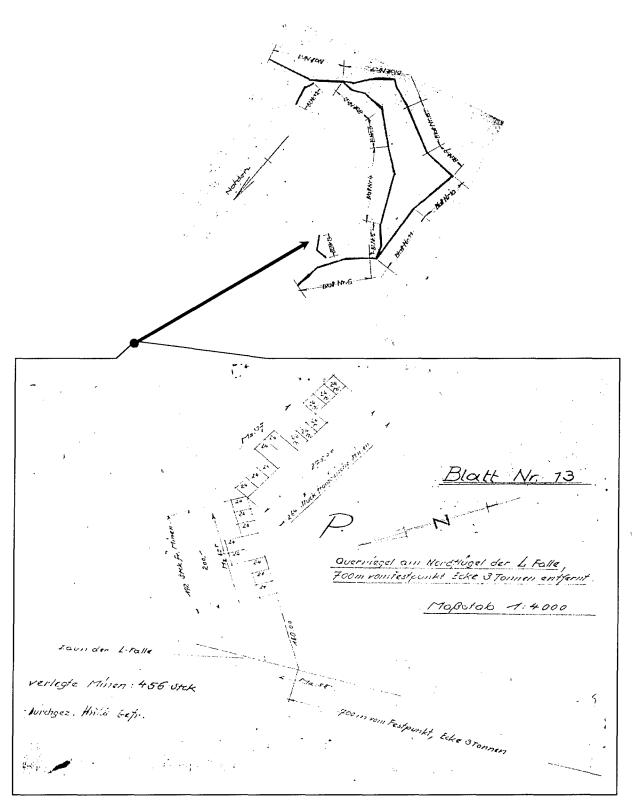

Blatt 11, Mine Box L

Note: Blatt 5 (page E-40) adjoins the north end of Blatt 11.

Blatt 12, Mine Box L

Note: Blatt 1 (page E-36) is located to the south of Blatt 12.

Blatt 13, Mine Box L

Note: Blatt 6 (page E-41) is located to the west of Blatt 13.

### Appendix E, Annex 3e. Later Mining Activity in the 2<sup>nd</sup> New Zealand Division Zone<sup>ix</sup>

On 6 October 1942, the 164<sup>th</sup> Leicht Afrika Division published a document that addressed the emplacement of new minefields, randomly laid mines, command-detonated mines, wire obstacles and material requirements, which stated that the division still had 4,400 antitank mines, 890 aircraft bombs, 2500 rolls of wire and 375 long pickets allotted to it. The division directed that in the future both antitank and antipersonnel mines were to be emplaced at a density of 1 mine per meter, while the command-detonated bombs were to be emplaced at a density of 10 per 100 meters of front. The remaining wire was to be used to provide a more complete tactical obstacle to the front, while a perimeter fence was to be emplaced around each company. In an area that included part of Mine Box "K," all of "L," and part of "J," the division reported the employment of 3600 antitank and 7000 S-Mines, along with 700 bombs, 3000 rolls of wire, 2625 long pickets, and 5250 short pickets. Six hundred antitank and 7000 S-Mines, along with 1500 rolls of wire, 2625 long pickets, and 5250 short pickets were still available to this sector. This left an estimated short fall of 3000 antitank mines, 700 bombs and 1500 rolls of wire.

#### Mine Box "K"

In September, the 220<sup>th</sup> and 900<sup>th</sup> pioneer battalions reported emplacing 455 antitank and 164 antipersonnel mines in Mine Box K. In October, they reported the emplacement of 3115 antitank and 1213 antipersonnel mines in Mine Box "K." For example on 11 October, *Hauptmann* Streitz, commander of the 220<sup>th</sup> Pioneer Battalion, reported that "Between 'K' and 'L' the emplacement of an antitank minefield was begun. 408 Tellermines were emplaced along of length of 800 meters."

#### Mine Box "L"

In September, the 220<sup>th</sup> Pioneer Battalion reported emplacing 1406 antitank and 64 antipersonnel mines. For 10 October, *Hauptmann* Streitz, commander of the 220<sup>th</sup> Pioneer Battalion, reported that "In 'L' – in the western part, emplaced 82 command-detonated bombs and 432 S-Mines at a length of 450 meters along the length of the antitank minefield." The battalion emplaced another 288 antipersonnel mines in Box "L" on the same day. During the battle, the 220<sup>th</sup> Pioneer Battalion emplaced 4751 antitank mines in front of the 2<sup>nd</sup> New Zealand Division (see section 6.7.9. and 6.10.2.2.).

# APPENDIX E, Annex 4. WORLD WAR II GERMAN MILITARY SYMBOLOGY<sup>xi</sup>

The symbols in this work are based on the official German handbook of military symbols (H.Dv. 272) of 24.03.1941, (with changes up to November 1941) and the actual symbols used in the organizational charts (Kriegsgliederungen des Feldheers, (15.05.1941 through May 1942)). Where symbols in the latter are at variance with the former, those symbols of the organizational charts have been used.

In German organizational charts (and, as reflected here), the headquarters symbol represents two purposes. First, it indicated the size, function, and mobility of the unit. And, second, it also indicated the headquarters of that echelon itself, i.e., there was no separate symbol for this echelon's headquarters. For all headquarters units with (and sometimes important units without) separate KStN (Kriegstärkenachweisung – equivalent to a "Table of Organization and Equipment"), the corresponding symbols were placed to the right of the echelon's symbol. The same applied to those units that were directly assigned to the echelon's headquarters.

The different functions and mobility additions were used to enhance the echelon's symbol to indicate a specific purpose. Company-sized units and sub-units symbols were also modified in a similar fashion.

The Germans numbered their units on organizational charts from the right, i.e., the first company was on the far right, and the last company was on the far left. The same applied to battalions and regiments.

An interesting feature of company and sub-unit symbols is that their size and shape dimensions could be altered to fit the diagram being depicted with them. Several infantry companies, for example, were placed side-by-side, elongated upwards, (so that all weapons symbols could fit within), and only the left-hand company had the thickened edge used to indicate its size (more of this below). The variations in size and shape followed the original configuration, so that the basic symbol was still recognizable as such.

The symbols were intended to be mnemonic. The headquarters symbols reflected the units' pennants used on vehicles or the standards themselves. (These flags and pennants were of different colors to represent the various combat arms, and usually had a number, letter, and/or heraldic symbol superimposed upon them). Hence, any German looking at one of these symbols could immediately recognize the unit type being depicted. The colors in real life were substituted by the unit function and mobility modifiers above and below the symbols. In addition, a simplified version of the organizational symbols was, for example, painted on unit vehicles.

The mobility of the unit was also quickly recognizable. The two small circles ('wheels') underneath a symbol identified the unit as being motorized. In case these wheels were over the symbol (applied only to artillery-type units), this indicated that the unit was motorized by half-tracked prime movers. Elongated ovals ('tracks') applied underneath the symbol meant that the unit was self-propelled.

All units assigned to Panzer divisions were at least motorized, so that it was thought that the addition of the motorization wheels to the upright staff symbol could be dispensed with, and that the Panzer-Truppen pennant was indication enough.

Although the official handbook indicated that armored infantry units should have the halftrack symbol underneath them instead of the motorized symbol, this practice was not yet followed in most organizational charts at that time. The diagrams in this book reflect this usage.

The lozenge symbol represented armor. All tank units used this symbol. It was shaped to reflect World War I tanks, and hence provided a good memory assist.

xi "German Army, 1941 – 1942 Organizational Symbols High Command," by Leo Nichorster, available online at: <a href="http://www.orbat.com/site/ww2/drlco/011">http://www.orbat.com/site/ww2/drlco/011</a> germany/symbols/ symbols 41.html, "an excerpt of the 176 page handbook (*H.Dv. 272 - "Muster für taktische Zeichen des Heeres"*, dated 24.03.1941.

Aside from a very few specialized symbols, which were quickly memorized, all company-sized and smaller unit symbols tended to reflect the units' function or at least their main weapon. In most cases, a unit too difficult to depict easily was instead represented by a box with a corresponding abbreviation inside. In case it belonged to a particular arm, the arms symbol could be placed on top of or within this box. Where various modifiers applied, these were all added to the symbol.

Company-sized units had, somewhere within their symbol, a thickened part, usually a side.

Excluded from this were the firing artillery (tube, rocket-launcher, and Army anti-aircraft) batteries. There, the weapon symbol itself in firing batteries (usually with the number of guns underneath) indicating a battery. (Firing artillery, in units smaller than battery size was depicted on a smaller scale). None-firing batteries of the artillery arm followed the normal form of thickening a portion of the symbol to indicate their size. Infantry-type artillery (anti-aircraft and infantry gun) as well as machine gun companies followed the normal practice, and the weapon symbols representing these types of companies had the upright stems thickened accordingly.

Where several columns, platoons, or detachments were gathered into a headquarters company or heavy company (and each of these sub-units had its own KStN), these symbols were enclosed in a box without a thick side.

Units smaller than companies appeared on organizational charts only if they had their own Table of Organization. Exceptions occurred, particularly if headquarters sub-units had specialized equipment. They were depicted on a smaller scale than company-sized units.

### Staffel

(Detachment) An elastic designation for several components under a headquarters section, these components being from section to platoon size. Often this was merely an administrative grouping, and the components were distributed to other sub-units in combat. It could either have its own small headquarters section, or one of the components' leaders could carry out a dual function.

### Kolonne

(Column) An independent transportation unit, varying from platoon to company size, transporting equipment or supplies such as a bridge column (which in fact did not actually build the bridge it was transporting), or even as a light 'infantry' column (which consisted of a set number of horse-drawn vehicles capable of transporting a fixed tonnage).

### Zug

(Platoon) An independent unit or the typical main sub-division of companies and batteries. Usually, the 1st and 2nd platoons in each company-sized unit, and also of independent platoons, were lead by a lieutenant, while the other platoons were headed by a senior NCO.

### Trupp

(lit. Troop; Section) A small unit equipped with specialized equipment; it could also be used as the designation for a headquarters echelon unit (Kompanie-Trupp: Company Headquarters; Zug-Trupp: Platoon Headquarters, etc.).

The units indicated below were not depicted as separate symbols.

### Halb-Zug

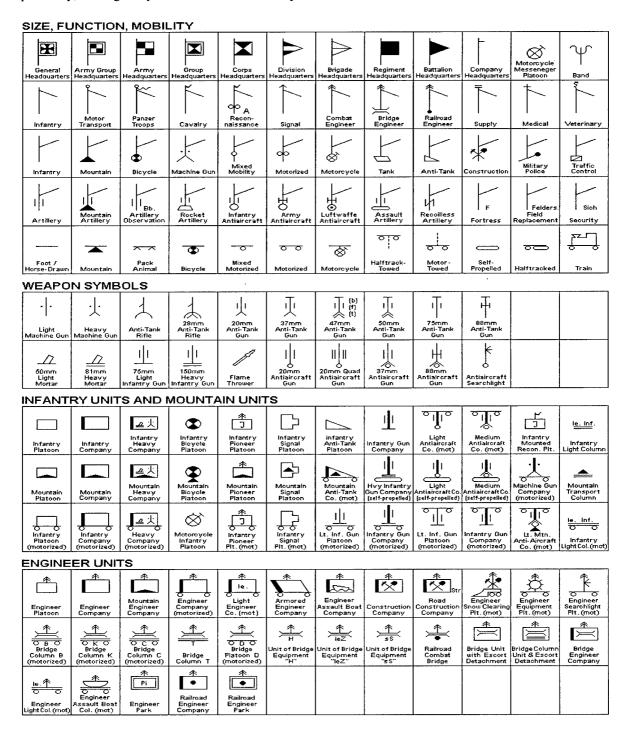

(lit.: Half-Platoon) Some platoons, for example HMG Platoons, could be divided into two parts.

### Gruppe

(Squad, Section) This was normally the smallest sub-unit that existed in the German Army. In this work, the word "Squad" has only been used for infantry and reconnaissance infantry units. All other units of this size have been designated as "Sections".

### Halb-Gruppe

(lit. Half-Squad, i.e. Team) In the case of infantry and reconnaissance units, squads could be broken down into two parts. Infantry and reconnaissance squads were built up around the squad LMG. Where only one LMG was provided, the LMG team provided cover while the other team was the movement element. Where two LMG were available, the teams covered each other in turns. Reconnaissance teams, on the other hand, were trained to work independently, although they too could function as a squad.

# APPENDIX F GERMAN MINE WARFARE DOCTRINE AND POLICY

Annex 1. Extract from <u>Ausbildungsvorschrift für die Pioniere, Teil 4b, Minen und Zünder</u>, H. Dv. 220/4b, 1 October 1939.

Annex 2. Special Orders for Mine and Obstacle Employment from Oberst Hecker and his Staff

- a) New Method of Arranging Minefields ("Mine Boxes")
- b) Special Order for Mine Employment Nr. 8
- c) Special Order For Obstacle Employment Nr. 3

Annex 3. Chapter IV. "Tactics," Section VII. "Minefields," extracted from <u>Handbook on German Military Forces</u>, TM-E 30-451, War Department, Washington, D. C., 15 March 1945.

### APPENDIX F, ANNEX 1.

# Extract from <u>Ausbildungsvorschrift für die Pioniere</u>, <u>Teil 4b</u>, <u>Minen und Zünder</u>, H. Dv. 220/4b, 1 October 1939.

### F. Mining of Roads, Paths and Areas

- 134. For mine obstacles to delay enemy movement on roads and paths (march obstacles), the following are in effect:
  - a) Gravel, asphalt, or concrete roads are only mined where speed and perfect camouflage are possible. These roads can only be obstructed by mining soft shoulders or fair weather paths. There, perfect camouflage is possible. Also with broad roads, these shoulders must suffice.
  - b) When the mining of paved roads is executed, places with poor paving stones or thin pavement are most favorable. Perfect camouflage is possible here.
  - c) This mining must not be too dense and must have great depth.
    - Even 100 meters or more with only one mine has a great effect. With dense employment, the enemy detects them easily, and the mines are quickly found and neutralized.
  - d) Dummy emplacements are used on this occasion, especially on hard road surfaces, as well as asphalt and concrete roads. The scattering of unarmed mines increases the delay effect.

### On the furthest side toward the enemy, unarmed mines are placed for laying.

135. The positioning of mine obstacles on the terrain as tactical obstacles is determined by the situation, mission, site, terrain form, weather, illumination, time, strength, and number of mines more than manner of laying and pattern.

Illustration 71-81, especially 77, 78, and 81 give examples thereof.

The maximum extent for continuous minefields is prescribed:

- a) for buried minefields go to Illustration 77,
- b) for surface laid minefields 100 meters.

Gaps of 50 paces are directed to be placed between continuous minefields. They serve as protective strips against sympathetic detonation. The gaps are covered by overlapping minefields (see Illustration 78). Prevent the constant use of protective strips against sympathetic detonation as passage lanes through the minefield. The wheel tracks and worn paths can be detected by the enemy and show the way through the minefield.

As more supplies of mines become available, minefields can be reinforced with additional minefields, which can be laid right behind them, for example, a minefield with 1 Tellermine per meter of front can be increased to 2 Tellermines per meter of front.

### 136. Dimensions for Distances between Mines:

- a) For buried camouflaged mines, at least 5 paces (4 meters) from center to center for Tellermines.
- b) For surface laid, superficially camouflaged or un-camouflaged mines, at least 10 paces (8 meters) from center to center for Tellermines.

For intact minefields, the probability of effect against motor vehicles of all types is:

- 2 Tellermines per meter about 60%
- 1 Tellermine per meter about 30%
- 1 Tellermine per 2 meters about 15%

137.

a) The form of the squad in combat can be regarded as a prop for the emplacement of mines. Thereby, each man in the 12-man squad is assumed to have 2 Tellermines. The most practical form of emplacement is the "Mine Pack" (previously the Rifleman's Pack).

The "Squad Column" is the form selected for blocking a hollow or defile.

By giving up minefield depth, the "Mine Skirmish Line" (previously the fire skirmish line) swiftly obstructs a wide area.

b) Measurement of emplacements with the two-meter staff or tape measure is cancelled. The distance between mines will only be paced, in so far as they are not already given through the battle formations. It is prohibited to emplace Tellermines in depressions (Illustration 24). To begin with, each man lays down his first Tellermine, then he moves the prescribed number of paces forward and to the right (or left) and lays down his second Tellermine. After the

Tellermines have been laid down, the squad leader moves to the front of his minefield and corrects any disparities (for instances, inaccurate pacing between two Tellermines).

c) After emplacing and arming the Tellermines, the Tellermines are buried and camouflaged. The Tellermines are armed on a special order. The arming begins with the Tellermines laid closest to the enemy. As these Tellermines are armed, the men move back, and then the next Tellermines are armed and so on. The arming wires with hook are given to the squad leader. These are kept so that later the mines may be removed and collected.

138. For standardized training, the following signals are used:

**Emplacement of Tellermines-**

Squad leader turns his head and thrusts out his arm and thrusts the other arm under it while bending slightly forward with the upper part of the body down (movement of emplacement);

Proceed to the emplacement of the

second Tellermine-

Squad leaders thrusts his arm several times high;

Begin Arming-

Squad leader strikes in "Straddle Position"-facing the squadunder forward bend of the upper part of the body with a slight forward extending of the arm between the legs to the rear

(movement of arming).

In darkness the same signals are given with a dimmed flashlight.

With the use of a whistle:

Halt!

-1 short whistle,

Lay down Tellermine

Begin arming

-2 short whistles,

Proceed to lay the second Tellermine

-5 short whistles, -twice alternate a long and a short whistle.

139. In case a squad, due to having to employ a machine gun or casualties, has a strength of less than 12 men, they will begin to emplace on the enemy side a part of each squad minefield in the ordered density (ref. Illustrations 71 & 72), and then proceed to emplace the rest of the 24 Tellermines.

For instance, when a squad is only 9 men strong, it will begin by laying the first 18 Tellermines (each man with 2 Tellermines), while the remaining 6 Tellermines are laid at the appropriate interval and echeloned right (or left) by 3 men (each man with 2 Tellermines).

Legend for Illustrations 71 to 81.1

↓=Approach direction of the enemy

X=Pace

•=First Tellermine of each man

O=Second Tellermine of each man

The Tellermines are distinguished because there are no tailor-made symbols, especially for large-scale drawings.

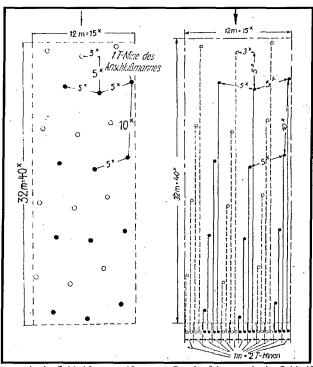

- a) For minefields emplaced in the ground and camouflaged, the center-to-center spacing of the Tellermines is at least 5 paces (4 meters). Only a rough estimate.
- 140. Illustrations 71 and 72 show squad minefields, patterns, and Mine Packet, in various densities.

Command of the squad leader:

To the left (or right) at five pace interval (laterally between mines) and ten pace spacing (longitudinally between soldiers) – Mine Packet!

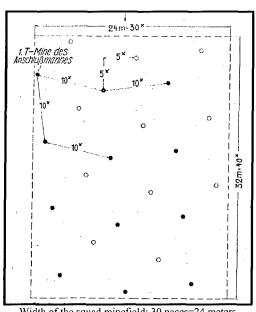

Each man lays his second Tellermine five paces forward and three paces left (or right) of his first Tellermine.

<sup>&</sup>lt;sup>1</sup> This legend does not apply for registration on maps and mine plans (Illustration 82 (not included)). Therefore refer to Table 4. "Tactical Mine Symbols Etc."

Width of the squad minefield: 15 paces=12 meters; Depth of the squad minefield: 40 paces=32 meters

Illustration 71. Squad Minefield, 2 Tellermines Per Meter, Laid by One Squad of 12 Men, Each Man with 2 Tellermines (Schematic representation, with Tellermines marked in a standard lay out.)

Width of the squad minefield: 30 paces=24 meters Depth of the squad minefield: 40 paces=32 meters

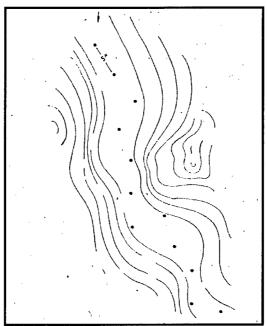

Illustration 72. Squad Minefield, 1 Tellermine Per Meter, Laid by One Squad of 12 Men, Each Man with 2 Tellermines

Command of the squad leader:

To the right (or left) at ten pace interval (laterally between mines) and spacing (longitudinally between soldiers) – Mine Packet!

Each man lays his second Tellermine five paces forward and five paces right (or left) of his first Tellermine.

141. Illustration 73 shows the obstruction of a defile with Tellermines, laid using the Squad Column.

Center-to-center spacing between Tellermines at least 5 paces.

Illustration 73. Obstruction of a Defile with Tellermines, Laid using the Squad Column, by 1 Squad of 12 Men, Each man with 1 Tellermine.

142. Illustration 74 shows a squad minefield, with the Mine Skirmish Line chosen as the configuration.

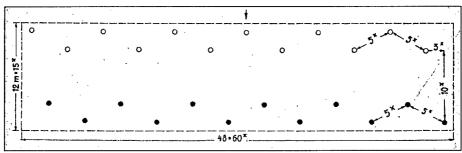

Illustration 74.

Squad Minefield in Mine Skirmish Line Pattern, 1 Tellermine Per 2 Meters, Laid by One Squad of 12 Men, Each Man with 2 Tellermines.

Command: At Five Pace Interval-Mine Skirmish Line!

Each man lays his second Tellermine ten paces forward and three paces left (right) of his first Tellermine.

**143.** Platoon-, company-, etc. minefields are illustrated through setting squad minefields side-by-side and echeloning them in depth, based on purpose, situation and terrain. Illustrations 75 and 76 show platoon minefields, Illustration 77 a company minefield.

Other methods of echeloning are possible; however, care must be taken that the mines along the seam are placed no closer than five paces (4 meters). The squad leader must balance those cases where Tellermines are placed closer than five paces. For this reason, he plans for an interval of 1 meter between individual squad minefields.

# 52m·40\* 12m·15\* 12m·15\* 12m·15\* 12m·15\* 12m·15\* 12m·15\* 12m·16\* 12m

### **Echeloned Right**

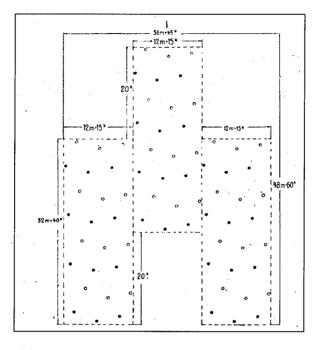

Illustration 75. Platoon Minefield with 2 Tellermines Per Meter, Laid by 1 Platoon of 36 Men, Each Man with 2 Tellermines.

Side-by-side placement of minefields results in the following widths:

	Platoon	Company
2 Tellermines per meter	45 paces=36 meter wide	135 paces=108 meter wide
1 Tellermine per meter	90 paces=72 meter wide	270 paces=216 meter wide

Illustration 75 (cont'd).

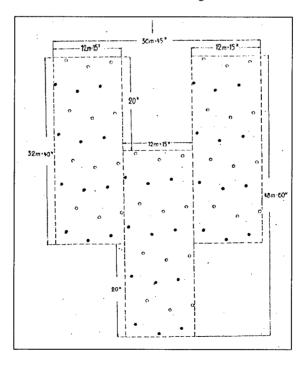

Platoon Wedge.

The same level for the rearward squad is not necessary.

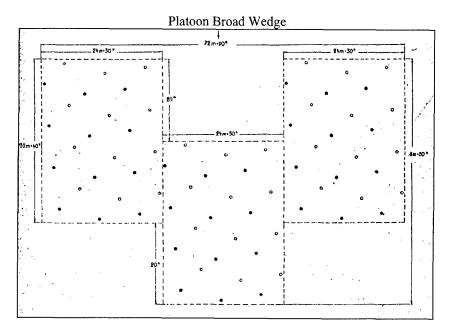

Illustration 76 (cont'd).

### Platoon Wedge

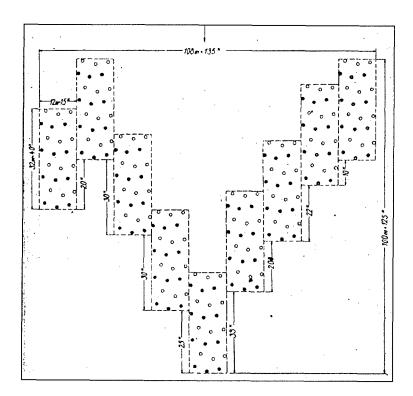

The same level for the rearward squad is not necessary.

### Illustration 76 (cont'd)

The same level for the forward squad is not necessary.

lllustration 77. Company Minefield, 2 Tellermines Per Meter, Laid by 1 Company of 108 Men, Each Man with 2 Tellermines

3<sup>rd</sup> Platoon: Platoon Wedge

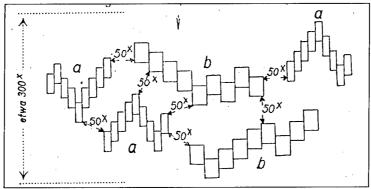

2<sup>nd</sup> Platoon Platoon Broad Wedge

1<sup>st</sup> Platoon Echelon Left Advantages of Echeloning:

- a) Makes reconnaissance difficult
- b) Artillery effectiveness reduced
- c) Slight risk of sympathetic detonation by very large explosive charges (refer to figure 151 (not included)).

If a minefield was emplaced according to Illustration 77 with 1 Tellermine per meter, then the combined width is 216 meters.

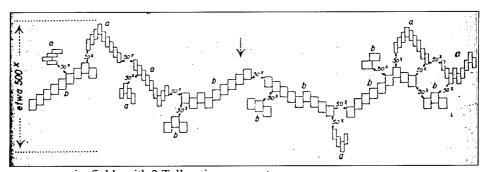

a) Camouflaged company minefield that is laid with a protective strip through company minefields.

a=minefields with 2 Tellermines per meter. b=minefields with 1 Tellermine per meter.

Illustration 78. Example of a Minefield with a Protective Strip to Counter Sympathetic Detonation.

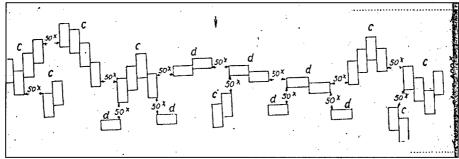

b) Camouflaged company minefield that is laid with a protective strip through camouflaged squad minefields.

a=minefields with 2 Tellermines per meter. b=minefields with 1 Tellermine per meter.

Illustration 78 (cont'd)

c) Surface laid minefield with a protective strip through surface laid squad minefields.

c=surface laid minefields with 1 Tellermines per meter, according to Illustration 79. d=surface laid minefields with 1 Tellermine per 2 meter, according to Illustration 80.

- b) Surface laid Tellermines (superficially camouflaged or un-camouflaged) emplaced by pioneer reserves in snow and frost as well as a rapid counter against an armored attack in the depth of the main battle area for instance. The center-to-center spacing of the Tellermines is at least 10 paces (8 meters).
- 144. For the rapid emplacement of surface laid Tellermines, the following configurations are practical:
  - a) Emplacement from march order (Illustration 79),
  - b) Emplacement by a line of 2 ranks (Illustration 80).
- **145.** The minefield from march order is emplaced upon the command:

Mine Emplacement from March Order! On whistle or hand signal.

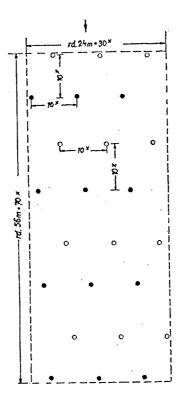

Illustration 79. Teller minefield Surface Laid by 1 Squad (12 Men), Each Man with 2 Tellermines, 1 Tellermine Per Meter of Front.

### For drill practice:

- 1. Squad X 10-pace interval (to right (or left) or to right and left).
- II. 1st rank 60 paces forward,
  - 2<sup>nd</sup> rank 40 paces forward,
  - 3rd rank 20 paces forward
  - 4th rank remains standing.
- III. 1<sup>st</sup> rank remain standing,
  - 2<sup>nd</sup> rank 1 pace to the right,
  - 3rd rank 3 paces to the right
  - 4th rank 4 paces to the right.
- IV. Each man lays his first Tellermine and places in it an armed Tellermine fuze.
- V. All 10 paces forward, 5 paces to the right.
- VI. Each man lays his second Tellermine and places in it an armed Tellermine fuze.

On order, the first rank arms the Tellermines laid closest to the enemy, the 2<sup>nd</sup> rank arms the Tellermines and moves back and so on.

A second squad employed behind the first, results in a minefield with 2 Tellermines per meter.

**146.** In the platoon and company, squads are placed side-by-side, without echeloning, so that a platoon front is 90 paces (72 meters) and a company front is 270 paces (216 meters). The density of the fields is 1 Tellermine per meter of front.

Deep echeloning, for example the employment of one company behind another, results in a minefield with 2 Tellermines per meter of the current front.

**147.** The minefield from the line in 2 ranks on the command:

Mine laying from the line in 2 ranks! By whistle or hand signal.

For drill practice:

- Both ranks at 10 pace interval (to right (or left) or in combination with adjacent man to right or left)
- II. 1st rank 20 paces forward, 2nd rank 5 paces to the right.
- III. Each man lays his first Tellermine and places in it an armed Tellermine fuze.
- IV. Both ranks 10 paces forward, 3 paces to the right.
- V. Each man lays his second Tellermine and places in it an armed Tellermine fuze.

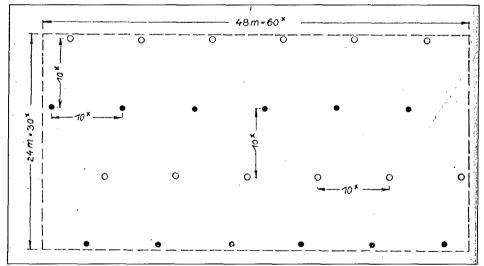

Illustration 80. Surface Laid Tellerminefield by 1 Squad, Each Man with 2 Tellermines, 1 Tellermine Per 2 Meters of Front

Arming will be on order. The  $1^{st}$  rank will begin with the Tellermines laid closest to the enemy, the  $2^{nd}$  rank arms their first mine when the  $1^{st}$  rank arms their second Tellermine and is moving back.

Two squads placed one behind the other; result in a minefield with 1 Tellermine per meter of front.

In a platoon and company, with squads placed side-by-side, free of echeloning, results in a platoon front of 180 paces (144 meters) and a company front of 540 paces (432 meters). The density of the minefield: 1 Tellermine per 2 meters of front.

Deep echeloning (with two companies placed one behind the other) results in a minefield of 1 Tellermine per meter of the current front.

148. Illustration 81 shows a surface laid company minefield with various emplacement configurations applied.

Also, using the squad configurations in the buried minefield in Illustrations 71 and 72, it is possible to follow Illustration 81. With the buried configurations, reduce the spacing appropriately.

This minefield, with both surface-laid and buried mines, has the fewest risks against the destructive effects of bombs, artillery shells and explosive charges.

(The following pages (95-116) have been extracted from the German Warfare Doctrine)

Qñ

# F. Verminen von Straffen, Wegen und Gelände.

134. Für Minensperren, die zur Berzögerung feindlicher Bewegungen auf Straßen und Wegen dienen (Marschsperren), gilt folgendes:

a) Schotter=, Asphalt= oder Betonstraßen werden nur dort vermint, wo schnelle und einwandsreie Tarnung möglich ist. In der Regel können diese Straßen nur an den nicht besestigten Rand= streisen oder auf Sommerwegen vermint werden. Dort ist einwandsreie Tarnung möglich. Auch bei breiten Straßen werden diese Känder benutzt.

b) Verminung von gepflasterten Straßen ist auß= zuführen. Am günstigsten ist schlechtes Kopf= stein= und Kleinpslaster. Hier ist einwandfreie

Tarming möglich.

c) Diese Verminungen dürfen nicht zu dicht sein

und müssen große Tiefe haben.

Selbst auf je 100 m und darüber nur eine Mine hat große Wirkung. Bei zu dichtem Einssat, der seindliches Spüren erleichtert, werden Winen rasch gesunden und unschädlich gemacht.

d) Scheinanlagen sind hierbei anzuwenden, besonders auf sesten Straßendecken, auch auf Asphalt= und Betonstraßen. Einstreuen von scharfen Minen erhöht die verzögernde Wirkung.

Um weitesten seindwärts sind stets scharse Minen zu verlegen.

135. Beim Anlegen von Minensperren im Gelände als Gefechtssperren entscheiden Lage, Auftrag, Gelände, Bodenform, Bodenart, Wetter, Beleuchtung, Beit, Kräfte und Minenzahl über Verlegungsart und sorm.

Die Vilder 71—81, insbesondere 77, 78 und 81,

geben Beispiele dafür.

Für zusamenhängende Minenselder ist dabei als Höchstmaß der Lusdehnung vorgeschrieben:

a) für im Boden verlegte Minenfelder na Air 77.

für offen verlegte Minenfelder 100 m.

Zwischen zusammenhängenden Winenselbern sub assischer sus Swischern non 50 Schritt Abstand und Zwischerum anzuordnen. Sie dienen als Schuhstreisen gegen Zerfnallübertragung. Die Eassen werden durch auf Aufe verlegte Winenselber gedeckt (s. Witd 78).

Au unterbinden ist, daß die Schutskreisen gegen Zerknallibertragung ständig als Gassen durch das Winenseld benutt werden, da sonst entstandene Wagenspuren und Trampelpsade dem Geguer den Weg durch das Winenseld zeigen.

Winenfelder können bei später eintressen Misnennachschub durch Anlegen eines weiteren Winenfeldes, hinter dem bereits derlegten "tressenwise" gestasselt, verstärtt werden, 3. A. ein Winenfeld, das bisher nur eine T-Wine auf 1 lib. m der Arcite des Winenfeldes auswies, zu einem solchen mit zwei T-Winen auf 1 m.

# 136. Mage für Abstände von Minen:

a) Für im Boden verlegte getarnte Winen von Witte zu Mitte T-Mine mindestens 5 Schritt

= 4 m. b) Für offen verlegte, flüchtig getarnte oder ungetarnte Minen von Mitte zu Mitte TeMine mindeftens 10 Schritt = 8 m.

Wirkung gegen Fahrzeuge aller Art (Wahrschinlichkeitswerte) bei unzerstörten Minenselbern:

2 T-Minen auf 1 m rb. 60 %,

10. 10 %.

137. a) Für das Berlegen der Minen gelten die Formen der Eruppe im Gesecht als Anhalt. Dabei ist die Eruppe zu 12 Mann angenommen, jeder Mann 2 T-Minen. Zwedmähigste Form sür das Verlegen ist das "Winenrubel" (früher Schützenrudel).

. Zum Sperrén einer Neufde oder eines Hohlveges wird als Berlegungsform die **"Schühenreihe"** ge<sup>s</sup> wählt.

Sind unter Berzicht auf Tiese des Minenselbes rasch breite Räume zu sperren, wird die "Minenkette" (früher Feuerkette) genommen.

b) Melsen mit dem Zweinneterstab oder Bandnag beim Berlegen entsäll. Die Ensernungen zwischen den Minen werden nur abgeschritten, soweit sie nicht bereits durch die Ersechtssorm gegeben sind weinen werden zweigegeben sie Aseim Leestegen ist darauf zu achten, daß die T-Winen nicht in kurze Ersändevertiesungen (Vild 24) gelegt werden. Jeder Mann legt zunächst seine 1.T-Mine ab, geht dann die besohlene Schrittzahl vor und nach rechtss (links) und legt seine 2.T-Wine ab. Nach dem Abelegen der T-Winen geht der Erwine geht der Erwide kront seines Erwinen geht der Erwide über liegen der T-Winen geht der Erwige ungenauen Abschleimmigkeiten (z. B. wenn sich insolge ungenauen Abschleibens zwei T-Minen decken) ausgleichen.

c) Rach dem Ablegen werden die T-Witnengünder aller T-Winen auf "Sch ar f" gestellt, die T-Winen werden werden eingegraben und getarnt. Entsichert werden die T-Winen erst auf besonderen Bescht. Mit dem Enstschen wird bei den am weitesten feindwärts der legten T-Winen begonnen. Sind diese T-Minen entsichert, gehen die Leute zursich, erst dann werden die nächsten T-Winen entslichert usw. Subject: New Method of Arranging Minefields ("Mine Boxes").

To

Army High Command

General Staff of the Army/General der Pioniere und Festigungen

<u>I.</u> <u>Naming</u>:

The "Mine Boxes" in the subject are called "obstacle areas" here.

### II. Construction of the Obstacle Areas:

- 1.) For the position and expansion of the obstacle areas within the context of the El Alamein front go to Appendix 1 (drawn in red).
- 2.) Description of the Obstacle Areas:

Average width 3.0 km, depth up to 4.0 km. As much as possible, each point of the obstacle areas must be able to be covered by the heavy weapons of the infantry as well as Flak and artillery fires.

3.) Construction of an Obstacle Area:

The <u>entire</u> obstacle opens on a small battle area of about 500 to 800 meters deep at the forward edge (for combat outposts or forward deployed companies) with orders to stand within the mine-covered area.

Here dense, random and dummy minefields are laid and large numbers of command-detonated mines are emplaced, with fuzes leading to the edge of the positions on the obstacle area.

For example see Appendix 2. (Obstacle Areas H, J, L).

- 4.) Emplacement Configuration of the Minefields:
  - A) Emplacement Configuration of the individual dense minefields: Mine Panel.
  - B) Mine Density:

With dense minefield against tanks

1 mine per meter of front

With random minefield against tanks

1 mine per 3 meters of front

With dense minefield against riflemen

1 mine per meter of front

- C) <u>Depth</u> of the Minefields: 56 meters for dense minefields (anti-tank and anti-personnel) laid within a 300meters deep irregularly laid strip.
  - 2-400 meters with random minefields
- D) The range of the minefield from the forward positions: about 100-200 meters, each position of mines within the 300-meter wide strip.
- 5.) Command Detonated Mines.

Employed in the greatest possible number <u>in</u> the obstacle areas as well as <u>in front of</u> the combat outposts. Here we use principally captured English aircraft bombs of 10 to 50 kilograms weight, additionally more mines (for instance: mine clusters of 5 captured mines) and explosive charges (English munitions).

About the placement of command detonated mines as well as the firing point see Appendix 2.

6.) Fuzing Methods:

Each fuze device used the available electric initiator and pull-fuze (the latter with up to 1,000 meters length).

<sup>&</sup>lt;sup>2</sup> US National Archives, Captured German Records, Division 4.

The cutting of the firing wire by artillery fire occurs frequently, when the firing wires were not buried. Due to the large amount of frictional resistance, <u>pull</u> wires cannot be buried.

Because of the vulnerability of the initiators, each command-detonated mine was fuzed with three additional pressure mines and tripwire mines within a radius of 10-30 meters and linked with detonating cord.

Foreign anti-personnel mines were also used as pressure mines.

The effect of the command-detonated mines was increased (fragmentation and <u>morale</u> effects), when they were emplaced <u>upon</u> the ground. Here the business of camouflage toward the enemy is important. (Here camelthorn, sheet metal from destroyed vehicles, barrels and useless canisters).

- 7.) Employment of Minefield Fencing (see Appendix 2): A) All minefields received a fence on their friendly side. In general, this was coincided with the positions wire obstacles. Within an obstacle area it was given no wire of any kind. B) Near the squad strongpoint(s) of the combat outposts' perimeter mining and wiring was carried out. (The mines on the enemy side were not marked!)
- III. The average expenditure of mines, munitions, and material for 1 obstacle area including front mining (for details see Appendix 3):
  - 1.) Mines: 26,700 anti-tank mines and 8,000 anti-personnel mines.
  - 2.) Bombs of all types ~250 (used as mines):
  - 3.) Fuzing:

A) 5 Blasting Machines (or batteries)

125km of firing wire, (captured cable)

250 Electric Blasting Caps 19 km of detonating cord

250 blasting caps

Or

B) 125km of smooth wire,

250 pull-fuzes,

19km of detonating cord, and

250 blasting caps.

3.) Barrier Materials for Fencing:

36km barbed wire (or S-Rolls),

2,400 long pickets, 1,800 short pickets

## APPENDIX F, ANNEX 2b.3

Headquarters, Panzerarmee
Afrika
Abt.Ia/Pi Nr.1468/42 secret command issue.

15 Copies 2<sup>nd</sup> Copy

#### Special Order for Mine Employment Nr. 8.

#### I. Obstacle Areas:

- 1.) The new El Alamein position will be through obstacle areas
  - A) In front of our front (for instance: A1 and A2)
  - B) In the depth of the defensive zone (B, C, D, E, J, H, K) Appendices 1-5 <u>Strengthened</u>.

#### 2.) Purpose is:

To A) to make the enemy's approach and penetration more difficult,

To B) to lure the enemy into the obstacle areas and destroy him it through mines and the fire effects of the troops surrounding the obstacle area.

- 3.) The battle is to be conducted such that the general fronts of the minefields are to be defended to the utmost. The minefields, lying under the constant overwatch of our own fires, can only be cleared by the enemy with great difficulty and large losses. Overwatched minefields are the best tank obstacle. On the other hand, from the fronts of the obstacle areas into the depth of the defensive zone, only small battle groups are defending at this time.
- 4.) Upon the order of the unit commander the last evacuates with strong enemy pressure on both sides. The element that evades the enemy is immediately returned again to the battle.
- 5.) Unit leaders are responsible for the timely closing of gaps into neighboring areas. Special gaps are to be marked for the combat leadership and reconnaissance of the obstacle areas, the troop commander, based on tactical requirements, determines the position and characteristics of these gaps. The commander of the troops deployed in the obstacle area and the senior pioneer of the division are instructed to work together in the strictest understanding.
- 6.) A part of the obstacle areas are already completed. The approximate position and design of the remaining planned obstacle areas in conjunction with the mining of the front continues forward as shown in Appendices 1-5. Their exact location will be set based on the tactical point of view of the sector commander, in cooperation with the army pioneer commander. The pioneer commanders of the divisions will be brought in for that purpose. The army pioneer commander assumes responsibility for the overall management of the construction of the obstacle areas.

#### 7.) It will be constructed:

Obstacle Area	A1 A2 H J K	<u>Ву</u>	XXI Italian Corps and the 164 <sup>th</sup> Infantry Division, with the commitment and temporary support from the army pioneer commander (900 <sup>th</sup> Pioneer Battalion). Obstacle Area K is to be begun only with dummy positions without armed mines emplaced. Because of the present shortage of wire all boundaries here are to be marked with stone piles and English
Obstacle Area Obstacle Area	B C	<u>Ву</u> <u>В</u> у	canisters.  X Italian Corps (the eastern portion of B has already been finished by the 900 <sup>th</sup> Pioneer Battalion).  Deutsches Afrikakorps (finished).

<sup>&</sup>lt;sup>3</sup> US National Archives - Captured German Records Division.

Obstacle AreaDByXX Italian (Motorized) Corps.Obstacle AreaEBy90th Light Infantry Division.

8.) <u>Technical Details</u>: Obstacle areas A1 and A2 are placed outside of dense minefields and placed in randomly mined ground.

Obstacle areas B-K are, according to Appendices 1-5, to be provided with a strong wire fence along the outside. Danger signs are to be posted for our own troops. (Additional information on the locations of the dense minefields is given in Appendices 1-5). The gaps through the obstacle areas are marked by a simple wire fence. Both sides of the wire fence are left free of mines for 10 meters. The mining of this area is completed through random mining. Random mines are especially to be emplaced there, so that an attack of the enemy is checked. Their emplacement follows without a mark on the ground, their position is carefully hidden.

#### II. Mine Density:

The densities of all existing minefields of the El Alamein position (with the exception of random minefields) are to be increased to one mine per meter of front. This will be done through the emplacement of additional minefields toward the enemy, or only when the enemy situation forces it, on the friendly side. The new minefields and mine belts in obstacle areas C, D, E, J, H, and K will be laid with a density of one mine per meter of front.

This warning order is through the decision of 27 July effective.

#### III. S-Mine Employment:

Begin immediately strengthening the defense through the employment of S-mines. Because of the shortage of S-mines, for the time being these will only be used on especially endangered positions of the front.

- A) Approval to emplace S minefields is restricted to the army pioneer commander.
- B) S minefields are to be laid with a density of one mine per meter of front.
- C) S mines are only to be randomly emplaced in a small extent in special defiles in the terrain. The bulk of the S-mines are to be installed in minefields.
- D) The friendly-side fence of S minefields is to be built especially strong. Numerous warning signs will be set up for our own troops.

Careful measurement of the S-minefields is directed.

#### IV. Command Detonated Mines:

Immediately begin the installation of command-detonated mines.

- A) Command detonated mines will be laid on the approaches to the forward line at a distance of up to 400 meters. Their triggering requires special observers to find the enemy.
  - Since all types of mines can be command-detonated mines, especially heavy improvised mines and aircraft bombs will be used. Aircraft bombs will be arriving in 2-3 days at the forward pioneer parks.
- B) The main effort for the emplacement of command-detonated mines is in the approaches, in defiles and likely penetration points.
- C) Fuzing with all available means is authorized. An emplaced explosive charge is sufficient to cause the detonation of a mine or a bomb.

#### Attention is called to the following:

Electric fuzing with blasting machines or batteries,

Non-electric firing systems with time fuze and detonating cord,

Pull firing device with time fuze 24 or

Safety fuze and pull wire.

#### V. <u>Contamination of Wire Obstacles</u>:

Immediately begin strengthening wire obstacles through the emplacement of booby traps and Italian antipersonnel mines.

- A) Booby traps in wire obstacles are to be small explosive charges, detonated through the movement of the wire, yet not destroy the wire obstacle.
- B) Use all types of explosive munitions with pull fuzes.

C) The Italian hand grenades can with simple means be used to make a light anti-personnel mine. Their employment in wire obstacles is called to the attention of all Italian troops.

#### VI. Overwatching of Mine Lanes:

All of the mine lanes are to be overwatched by pioneers or infantry pioneers.

Be prepared to lay rapidly emplaced obstacles especially mines to quickly close the lanes. With the shortage of pioneer power infantry will be employed with only short training in rapid obstacles especially mines.

The tactical leader of the sector is responsible for adequate security measures especially for rapid closing. This warning order is through the radio traffic of 27 July effective.

#### VII. All-Arms Engineer Missions:

The strengthening of positions, wiring and installation of dummy minefields is the business of the pioneer services of all arms. Your attention is called once more to the shortage of pioneer forces. First reference to decision of 23 July 1942.

For the Army Command The Chief of the General Staff By Order and Proxy Signed v. Mellenthin

#### SECRET COMMAND ISSUE

Headquarters, Panzerarmee Afrika Abt.Ia/Pi Nr.2138/42 secret command issue. Army Headquarters, 10 October 1942

6 Copies 6<sup>th</sup> Copy

#### Special Order For Obstacle Employment Nr. 3.

1.) X Corps and Jaeger Brigade Ramcke as top priority construct a new front between grid line 255, Deir el Munassib and Deir Umm Khawabir. There, where the line of combat outposts are not mined like the approaches to the M.L.R., carry out the strengthening of the defensive power of the first line through antitank and antipersonnel mines in the fastest manner. It is important for everyone for the defense of the corps sector to check the minefields, especially English ones, that they have been thickened. Report the execution and results by <u>25 October</u>. Established gaps are to be closed immediately.

To the X Corps and Jaeger Brigade Ramcke will be given priority for the supply of mines and obstacle material.

- 2.) Hill 62 (1.5 km SSW of Deir el Shein) is to be secured by Jaeger Brigade Ramcke against tanks and infantry by including it within the combat outpost positions and through immediately emplaced mine obstacles. (Verbal Go-Ahead).
- 3.) XXI Corps and 164th Leicht Afrika Division urgently secures the new M.L.R. between obstacle areas with mine

The delivery for the mines required for completion of the construction probably follows on 20 October 1942. With the withdrawal of the M.L.R., the area east of Obstacle Area "K" as an approach is to be overwatched day and night, so that the current strong minefields remain effective against an expected tank attack. Inoperable firing wires to command detonated mines are to be removed. As far as possible, the valuable bombs

are to be linked by detonating cord with a mine.

4.) For the present, no further barrier materials will be available to the D.A.K. for the Qatani strip. The Qatani strip will be maintained primarily by the D.A.K. (It is important to avoid accidents).

The open and secret lanes as well as the gaps are to be secured. Pioneer forces and barrier materials are provided for the rapid closing as the enemy attacks. The intended employment is to be reported.

- 5.) The troops are once more to learn that:
  - a) A minefield only has a purpose when it is defended;
  - b) Antitank minefields constitute little if any obstacle to infantry;
  - c) With the currently small number of anti-personnel mines, especially careful overwatch of the minefields with small arms is of great importance.
- 6.) With all new mining, immediately reduce 20% of all antitank mine are to be secured for resumption. The most careful management of the list of mine plans is indicated.

For the Army Command The Chief of the General Staff By Proxy

# Secret Experiences in Mine Employment in the Last Months

#### I. Tactical:

The employment principles have once more worked completely. A division of pioneers as reinforcements have always proved inappropriate. Pioneers, especially when only available in limited strength, are instructed to cooperate, as this has shown to be more favorable.

#### II. Technical:

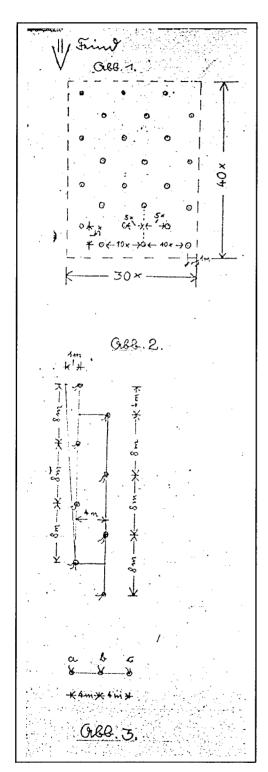

- 1. <u>Mine Types</u>. Except the German Teller- and S-mines, English Mark II, IV and V were laid without difficulties. With the Egyptian mines, some special safe handling procedures had to be established.
- 2. <u>Installation times</u>. The mass of mines was laid during night operations. Special difficulties were caused in attempting to lay the mines after a pattern caused, above all due to enemy action and terrain difficulties (rocky ground). The installation of S-mines at night and in enemy proximity appears advisable only if one does intend to take them up later.
- 3. Methods of Emplacement. The past schemes have worked satisfactorily. During direct enemy action and at night the pattern sketched in the plans worked best (Anlage [appendices] 1, 2). Here could all things be brought to full employment with partially trained replacements at short notice. The double stacking of Mark II mines, as well as the installation of bombs encountered serious difficulty in rocky soil. The time, which must be allotted at beginning, does not always stand in relation to the number of mines laid.
- 4. <u>Minefield Marking</u>. Marking the friendly and enemy sides with a high wire fence is most appropriate; a low fence is too easily overlooked and driven over. Friendly and enemy marking should appear 500 800 meters away to deceive the opposition. It is often a simple matter to build at this distance at night, above all if the minefields do not run in a straight line. K- and S-concertina rolls have proved useful as well for fast emplacement.
- 5. <u>Mine Clearing</u>. The English mines were generally easy to recognize during the day because of their poor camouflage. The battalion has suffered larger personnel losses only because the forces used in mine clearance in all cases had to create for themselves the conditions necessary to proceed with their assigned work, i.e. overpowering the enemy directly covering the mined obstacle. The mine detectors have proven themselves well, if maintained, that it is extremely sensitive in a combat zone.
- 6. <u>Successes Through Mine Employment.</u> The defensive power of mines was proven again during the English attacks around 21 July. Enemy forces were not only denied their freedom of movement, but numerous enemy tanks and motor vehicles were put out of action by mines.

# <u>Description of Mine Doctrine for the Emplacement of 1 Tellermine per Meter, or 1 English Round Mine</u>

#### Squad Minefields of 1 Tellermine per Meter

For the emplacement of 1 Tellermine per meter, the minefield must be divided into squad minefields according to figure 1, which are then appropriately aligned with the entire minefield. For a squad minefield one needs a squad with a strength of 1/12 (i.e. 1 non-commissioned officer and 12 enlisted soldiers). Each man lays 2 mines. Prerequisite for exact and fast mine emplacement is careful training, practice and experience within the squad. Each man must stop at a certain direction and exact pace count. In the case of nocturnal employment, particularly on dark nights, experience indicates that these difficulties result in inaccurate emplacement or a significant reduction of speed.

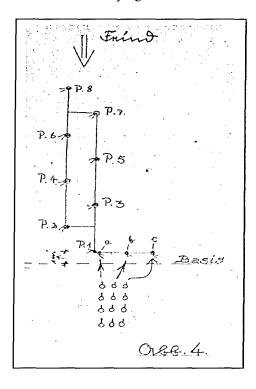

For this reason the company created and tested a Tellermine doctrine for 1 mine per meter. The instructions are given by a teaching troop of 1/6. The carrier troop of 1/12 lays the mines as directed at places marked by loops of white engineer tape. Since the squad minefield is too large to be covered by this instruction, it is divided in two.

The first part (figure 2) gives the distances. The markers are made of linen bindings, parachute cords or the like. To that, according to the illustration, place and fasten the white loops. The first part of the lesson is demonstrated by 4 men according to the process of the minefield.

Figure 3

The second part of the instruction covers the gaps. It is produced like the first part, and is continued by two men.

Emplacement occurs in the following manner. After the basis of the minefield is fixed, the first part of the mine lesson is laid out by figure 4.

F.d.R.d.A.:
Oberleutnant

Now Part 2 of the teaching troop (2 men) follows and behind it the carrier troop 1/12 (figure 4). Part 2 of the lesson now puts point "a" on point 1 parallel to the basis. The first file of the carrier troop puts its first mines on to the points a, b, c.

Part 2 of the lesson one takes up and again places it parallel to the basis at point 2. The first file of the carrier troop puts down its second mine. Thus Part 2 of the lesson up to the point 8 is always placed in the same manner and the carrier troop in each case lays its mines.

Then Parts 1 and 2 of the lesson is taken up and placed on the left or right, with the next squad minefield, while the carrier troop prepares new mines to lie according to the lesson.

In the same manner one can also lay 2 Tellermines per meter with appropriate changes to the Tellermine doctrine.

#### Description of the Emplacement of 1 S-Mine per Meter

Since with emplacement by S-Mine doctrine one often does not know the local soil conditions in the places where the mines are to be placed, which the S-Mine doctrine determines, one developed the following types of emplacement.

Placement of the base line [Basislinie], fixed points [Festpunkte] and auxiliary points [Hilfspunkte] occurs as with the emplacement according to the S-Mine doctrine. 2x [paces] from the first corner mine is the safety stake [Sicherheitspfahl] struck. At a distance of 20 meters the numbered intermediate stakes [Zwischenpfähle] are placed up to fixed point 1. The fixed point is specified and marked by a large stake and stones lying about.

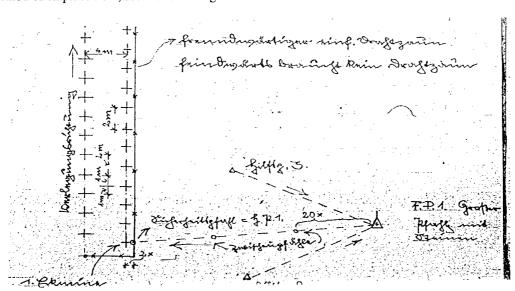

The fixed point is secured by three auxiliary points. They are placed at a predetermined distance and pace count from the fixed point to the safety stake and from fixed point to the auxiliary points. In the same way, at the ends of the minefield, safety stakes, auxiliary points and fixed points are set.

Troop organization:

- a) Survey Troop
- b) Fencing Troop
- c) Layout Troop
- d) Digging Troop
- e) Emplacement Troop
- f) Security Troop

The strength of these troops depends on the number of non-commissioned officers and crews available.

For the method of emplacement, see the following sketch.

In the same manner, 2 S-Mines can be emplaced per meter, by doubling the number of S-Mine rows.

In opinion of the company, sympathetic detonation seems impossible with this manner of emplacement.

# Geheim

Erfahrungen im Mineneinsatz der letzten Monate.

#### I. Taktisches:

Die Einsatzgrundsetze haben sich erneut voll bewährt. Eine Aufteilung von Pionieren unter Zugstärke hat sich stets als unzweckmäßig erwiesen. Pioniere, vorallem wenn nur wenig Kräfte zur Verfügung stehen, auf Zusammenarbeit anzuweisen hat sich als vorteilhafter gezeigt als eine Unterstellung.

#### II. Technisches:

- <u>Minemarten.</u> Außer den deutschen T- und S-Minen wurden engl. <u>Mark II, IV u. V ohno Schwierigkeiten verlegt.</u>
   Bei den agyptischen Minen wurde eine geringe Handhabungssicherheit festgestellt.
- 2. Einbauzeiten. Die Masse der Minen wurde im Nachteinsatz verlegt. Besondere Schwierigkeiten bereitete dabei das Verlegen nach Schema, vorallem bedingt durch Feindeinwirkung und Geländeschwierigkeiten (Pelsboden).

  Einbau von S-Minen bei Nacht und in Feindnahe erscheint nur rateam, wenn ein späteres Aufnehmen nicht mehr in Frage kommt.
- 3. Vorlegungserten. Die bisherigen Schemen haben sich bewährt.
  Bei unmittelbarer Feindeinwirkung und bei Nacht hat sich das
  in der Anlage skizzierte Schema bestens bewährt (Anlage 1,%)
  Hierbei konnten vorallen Dingen die zum Teil kurzfristig
  ausgebildeten Ersatzmannschaften voll zum Einsatz gebracht
  werden.

  Das doppelte Verlegen von Mark II=Minen, sowie der Einbau von
  Bomben stößt bei felsigen Boden auf große Schwierigkeiten.
  Die Zeit, die dafür in Ansatz gebracht werden miß, steht nicht

immer im Verhältnis zu der Zahl der eingebauten Minen.

4. Kennzeichnung der Minenfelder. Begrenzung freund- und feindwarts mit hohem Drahtzaun ist am zweckmäßigsten, niederer Zaun wird zu leicht übersehen und damit überfahren. Freund- und feindwärtige Begrenzung 500 - 800 mtr. ausein- ander zu legen erscheint zur Täuschung des Gegners zweckmäßig. In diesem Abstand zu bauen ist bei Nacht oft nicht einfach, vorallem wenn die Minenfelder nicht geradlinig verlaufen. Als gut brauchbar - weil schnell auszulegen - haben sich K- und S-Rollen erwiesen.

- 5. Minenräumen. Die engl. Minen waren im allgemeinen wegen ihrer schlechten Tarnung bei Tag gut zu erkennen. Das Btl. hat größere personelle Ausfälle dadurch erlitten, daß die zum Minenräumen eingesetzten Kräfte in allen Pällen sich erst die Voraussetzungen zu ihrer eigentlichen Arbeit, d.h. Niederkämpfung des unmittelbar auf die Minensperre einwirkenden Peindes, schaffen mußte.

  Das Minensuchgerfät hat sich gut bewährt, wenn gleich sich erneut gezeigt hat, daß es im Feuerbereich äußerst empfindlich ist.
- 6. Erfolge durch Mineneinsatz. Die Abwehrkraft der Minen hat sich bei den engl. Angriffen um den 21.7. herum erneut gezeigt. Die fdl. Kräfte wurden nicht nur in ihrer Bewegungsfreiheit gehindert, sondern zahlreiche fdl. Panzer und Kraftfahrzeuge wurden durch Minen außer Gefecht gesetzt.

gez. Andres.

# Beschreibung einer Einenlehre zur Verlegung von

Seheim

#### 1 T-Mine auf 1 m, oder 1 engl. Rundmine

Gruppenminenfeld 1 T-Mine auf 1 m

Bei der Verlegungsart 1 T-Nine auf 1 m muß das Minenfeld in Gruppenminenfelder Abb. 1 aufgeteilt werden, die dann dem entaprechenden Verlauf des Gesamtminenfeldes aneinandergereiht werden. Zueinem Gruppenminenfeld benötigt man eine Gruppe in Stärke 1/12. Jeder Mann verlegt 2 Minen. Yorangsetzung für ein genaues und schnelles Verlegen der Minen ist sorgfältige Ansbildung, Ubung und Erfahrung innerhalb der Gruppe. Jeder Mann mis eine bestimmte Hichtung und genene Schrittzahlen innehalten. Bei nüchtlichem Einsatz, inabesondere in den dunklen Nüchten, ergeben sich erfahrungsgemäß dabei Schwierigkeiten, die zu ungenauem Verlegen oder zu bedeutender Herabsetzung des Tempos führen.

Aus diesem Grunde hat die Kompanie eine T-Minenlehre für 1 Mine auf 1 m geschaffen und ausprobiert. Die Lehre wird von einem Lehrentrupp 1/6 gehalten. Der Trägertrupp 1/12 verlegt dann die Minen an den; an der Lehre durch Schleifen aus weißem Trassierband gekennzeichneten Stellen. Da das Gruppenminenfeld zu groß ist, um durch eine Lehre überdecht zu werden, ist diese in zwei Teile zergliedert.

Der erste Teil (Abb. 2) gibt die Abstände an Die Lehre wird aus Bindeleinen, Fall-schirmschnüren oder ähnlichen angefertigt. An den, aus der Abbildung ersichtlichen Stellen worden weiße Schleifen befestigt. Der erste Teil der Lehre wird von 4 Mann ent-sprechend dem Verlauf des Minenfeldes angelegt.

Abb. 3
Der zweite Teil der Lehre gibt die Zwischenräume an. Er ist gefortigt wie der erste
Teil, und wird von 2 Mann angehalten.

Olla. 3.

Das Verlegen geschieht auf folgende Art. Nachdem die Besim des L Minenfeldes festgelegt ist, wird der Teil 1 der Minenlehre angelegt Abb. 4.

Frind

Nun folgt Teil 2 der Lehrentrupp (2 Mann) und hinter ihm der Trägertrupp 1/12 (Abb. 4) Teil 2 der Lehre wird jetzt mit Punkt a an Punkt 1 parallel zur Basis gelegt. Die erste Rotte des Trägertrupps legt ihre erste Mins in die Punkte 2,6.c.

Teil 2 der Lehre wird aufgenommen und wieder parellel zur Basis an Punkt 2 angelegt. Die erste Rotte des Trägertrupps legt ihre zweite Mine ab. So wird Teil 2 der Lehre bis zum Punkt 8 immer in gleicher Art angelegt und der Trägertrupp legt jeweils seine Minenhinein.

Dann wird Teil 1 und 2 der Lehre aufgenommen und links oder rechts, beim nächsten Gruppenminenfeld angelegt. Während der Trägertrupp die von ihm verlegten Minen einbaut, werden vom nächsten Trägertrupp bereits neus Minen nach der Lehre verlegt.

In gleicher Art kann man nach entsprechenden Umbau der T-Minenlehre auch 2 T-Minen auf 1 m verlegen.

#### Annex 3.

# Chapter IV. "Tactics," Section VII. "Minefields," (Extracted from Handbook on German Military Forces, TM-E 30-451, War Department, Washington, D. C., 15 March 1945.) <sup>5</sup>

#### Section VII. MINEFIELDS

#### I. General

The Germans make extensive use of mines which they consider a most effective defensive weapon. Minefields are utilized chiefly to cover defensive actions and retreats, although limited use is made of them in offensive actions for flank protection. In a static situation the Germans regard minefields as an element of the front-line position, laid out according to an over-all mine plan developed in close conjunction with that for the fields of fire of all weapons. Within recent months, standard German doctrine for minefield location has been modified. Instead of laying dense minefields in front of the main line of resistance, dispersed mines are laid there, while the minefields proper are sited within the main battle position.

#### 2. Surveying of Minefields

The Germans consider it necessary to survey the location of minefields and individual mines within the minefields. German engineers are instructed to choose reference points (Festpunkte or FP) for minefields which easily can be identified. At a grade crossing, at the intersection of two improved roads, at the edge of a village, or some such favorable location, this can be done without any difficulty. In some instances, however, the Germans are forced to use "guide wire" and auxiliary fixed points (Vermessungspunkte or VI). A type of auxiliary fixed point that has proved practicable is the center of an equilateral triangle with sides 15 to 25 feet long. The corner points and the fixed point itself may be stakes, rails, or concrete or steel girders about 3 feet in length connected with barbed wire. Such a fixed point can be reestablished easily because even heavy shelling will rarely destroy more than one or two stakes.

A minefield is limited by the four corner points  $A_1$ ,  $A_2$ ,  $A_3$ , and  $A_4$ . The corner points are marked clockwise,  $A_4$  and  $A_2$  forming the base line on the German side. The survey of the field refers to one or both points of the base line. Auxiliary fixed points, called "mine stakes" (Minenpfühle), are used if necessary. Fixed points may be reference points found on the map or auxiliary fixed points established by the troops. Distances are measured in meters; azimuth readings are taken on the German issue compass—divided into 6,400 mils like the U. S. compass but read counterclockwise, and marked with the letters KZ (Kompasszahl). The new-type compass called

"march compass" has clockwise graduation and is indicated with the letters MKZ. The Germans use the magnetic azimuth and always proceed in their survey from the friendly toward the enemy side.

The Germans believe that it is advantageous to lay a continuous chain of reference points 600 to 900 feet apart, through a division sector. This chain can be used to determine the location of ditches, trenches, obstacles, and pillboxes, as well as minefields. Individual points are designated with Roman numerals, starting on the right flank of the division sector.

#### 3. Laying of Minefields

a. Patterns. To assure the greatest possible effect, minefields normally are laid out in definite patterns. The Germans make an exception to this practice, however, in sectors where they do not intend to undertake offensive actions. There they disperse the mines irregularly in the areas between defensive positions.

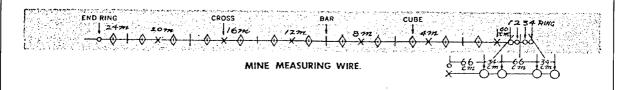

The main belts of a major antitank minefield laid in uniform pattern normally consist of antitank mines with a sprinkling of antipersonnel mines in the forward edge of the field. Both types may be fitted with anti-lifting devices, and some of the antipersonnel mines have trip wires attached. In some instances, these mines are placed in the intervals betwen the diagonal wires of a double-apron fence, with trip wires fastened to the diagonals.

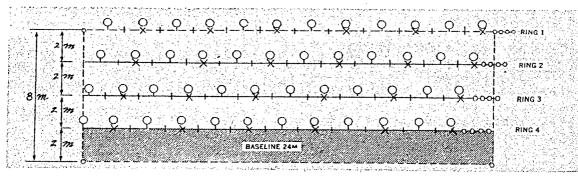

A number of antitank mines are laid in the forward edge of antipersonnel minefields to prevent armored vehicles from defonating the main belt of antipersonnel mines. The forward edges of minefields of all types often are sown with explosive charges placed in wooden boxes fitted with pressure fuzes. These act as both antitank and antipersonnel mines, and discourage the use of detectors to locate the mines.

Forward of most regular fields, and particularly in front of lanes, mines may be found widely spaced or scattered at random in unmarked groups. Mines also are laid in spaces running out at right angles from the forward edge of the minefield to damage vehicles moving along the field in search of lanes.

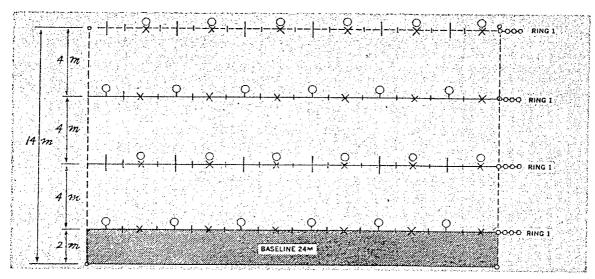

All pressure-type antitank and antipersonnel mines are laid in lines. For measuring distances and spaces, the troops use a mine-measuring wire (Minenmessdraht) which they themselves make

 $<sup>^5</sup>$  See also <u>Land Mines and Boobytraps,</u> FM 5-31, War Department, Washington, D. C., 1 November 1943.

from old telephone wire. (See Figure 15.) The mine-measuring wire is 24 meters (about 25 yards) long, and every meter (3 feet 3 inches) is marked with a piece of wood. The rings on the ends are about 5 inches in diameter. The measuring wire, in addition to measuring the distance

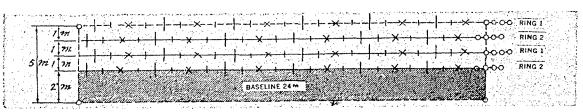

between fixed points, serves to lay out right angles by staking out a triangle with sides of 6, 8, and 10 meters respectively. Spaces between mines are determined by reference to the marks on wire; the four rings on one end are used to offset the rows.

			8	2
			12	3
		2 m (2.2 yds)	2	1
		İ	4	2
			6	3
Schü-Mine 42	Buried	1 m (1.1 yds)	1	1
	İ		2	2
			3	3
		½ m (0.55 yd)	1	2
			2	4

The density of a minefield depends upon the interval between mines and the number of rows. The table above represents the density.

Mine lanes are left open for patrols, and passage lanes for assault troops. For permanent patrols new lanes are made from time to time, and the old ones closed. A mine-free safety strip is provided on the Germans' side.

The Germans normally lay mine belts in individual sections 80 by 105 feet. The sections usually are staggered, and, for extensive mine belts, they are combined in units of three or four to form forward or reverse arrowheads, or echelons. Minefields arranged in echelon are surveyed by using corner posts on the hostile side of intermediate minefields as survey points.

The Germans emphasize that minefields must be covered by fire, although during a hasty withdrawal they often do not follow this principle. It is common for a regular minefield to have a listening post with two men at the rearward edge; about 70 or 80 yards farther to the rear there usually is a covering party of four or five men armed with one or two light machine guns.

When the Germans are in hasty withdrawal, they usually lay a large number of small nuisance minefields. These fields contain many different

types of mines, which often are unmarked and show every evidence of hurried laying. The consequent lack of pattern uniformity makes their detection and clearance a laborious and dangerous task. Though no consistency is noted in layout and types of mines used in such fields, the Germans show certain preferences in their choice of sites for them.

b. Location. In general, mines are laid either close to, or on, roads; on airfields and railways: and along telegraph routes. Surfaced portions of roads usually are avoided by the hasty mine layer, but khaki-painted T-Mines sometimes are placed on the surface at dips in the road, in the hope that drivers will be unable to check their vehicles in time to avoid them. The Germans also place mines along the shoulders of the road opposite narrow places where drivers have to detour to pass, and at the entrances to defiles where they have to pull off the road to wait for vehicles moving in the opposite direction. Other places usually sown with antitank mines are turnouts. sharp bends, the unsurfaced islands sometimes found at crossroads, berms, and well worn wheel ruts.

c. Concealment. The Germans, with great ingenuity, attempt to make their mines difficult

to detect. They bury them as much as 24 inches below the surface where they explode only after passage of a number of vehicles has compacted the earth cover sufficiently to operate the fuze. They put explosives in wooden boxes to prevent the effective operation of ordinary mine detectors, and mark tire prints in the earth on top of the mine by drawing a detached axle and wheels

The Germans also show considerable ingenuity in siting random antipersonnel mines on the line of the hostile advance. Road demolitions are plentifully sown with S-Mines, and kilometer posts at points where vehicular drivers have to dismount to read directions are similarly treated. S-Mines also are placed in ditches, often close to to the trip-wire peg of another mine.

Nuisance fields on lines of communication generally are closely spaced, occasionally so closely as to cause sympathetic detonation. This is particularly possible when mines are laid with their pressure plates almost flush with the surface of the ground and only lightly covered with earth.

German dummy minefields take various forms. In some cases a trip wire is laid to give the appearance of a minefield perimeter wire, with the usual lanes, and the ground is disturbed at regular intervals. Scrap metal, often dispersed with

real mines, is placed in shallow holes to cause a reaction in the mine detector. Dummy mines often are wired in and connected with booby traps,

#### 4. Marking of Minefields

The Germans stress the marking of minefields and attempt to mark them in such a manner that they cannot be recognized by the enemy but can easily be found by their own troops. Their methods of marking minefields are not uniform. The front edge of a field often is unmarked and unwired; the rear edge seldom so. Some fields have been found unmarked, but because of many accidents caused by their own minefields, the Germans issued orders within recent months making proper marking obligatory.

The following are typical examples of markings by the Germans, the type used depending on the situation and terrain: corner-post marking stakes; double-apron fence on the enemy side and a single trip wire on the friendly side, or the reverse; single knee-high wires; cattle fencing; empty mine crates; and signs.

The length of marking stakes varies with the terrain. They are flattened on one side for a length of about 8 inches. The flat surface is painted red, with the letter M (Minen) in black.

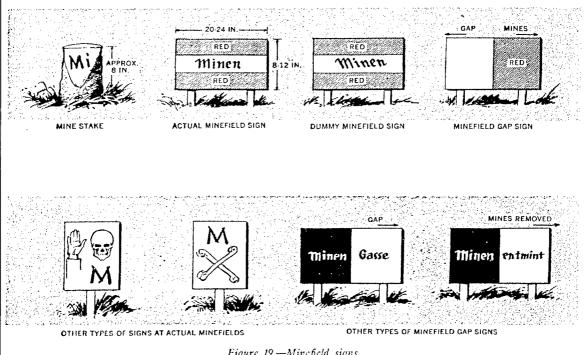

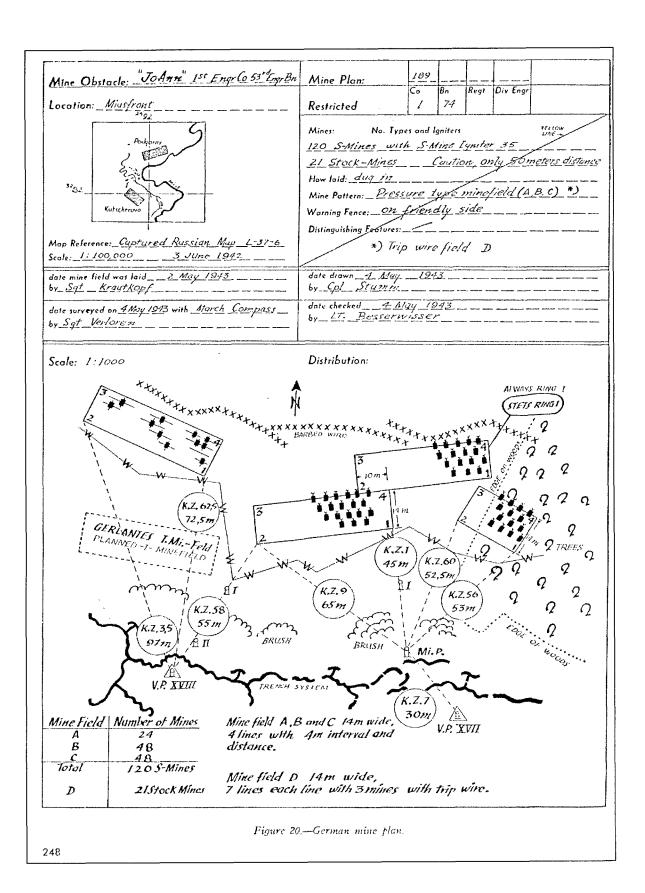

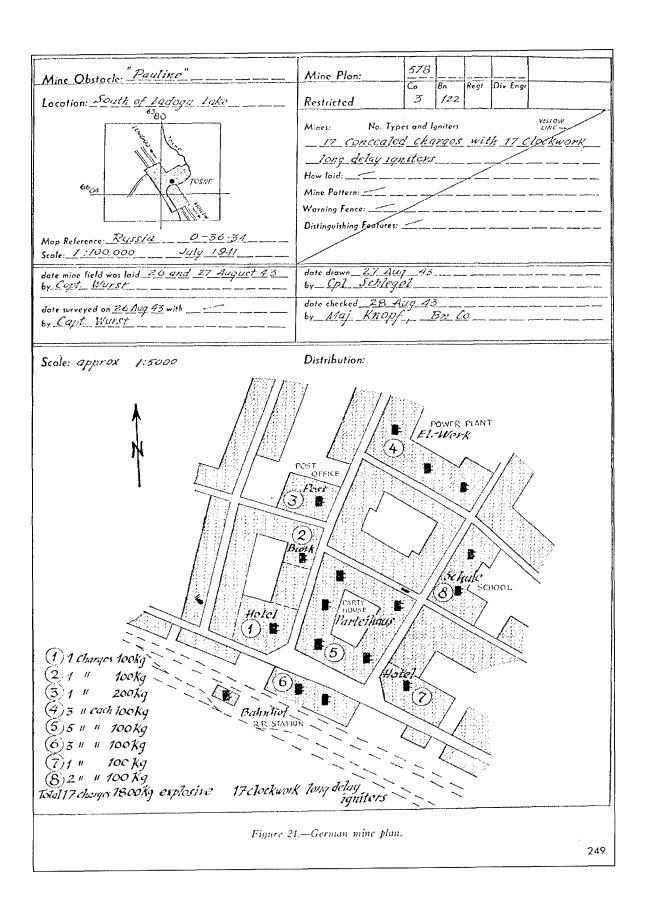

Figure 19,-Minefield signs.

Such stakes are used only on the friendly edges of minefields.

Signs are painted in red and white on boards or pieces of sheet metal, and fastened to two stakes. The edges of minefields are marked with signs showing horizontal stripes. Edges of lanes through the fields are shown by vertically divided signs with the white portion on the side of the lane, and the red portion on the side of the minefield (danger). The reverse side of the signs (the side toward the enemy) is painted olive drab. If red paint is not available, the Germans substitute black-and-white signs. They are painted with the following words:

Minen-for mines

Gasse or Gassen-for mine lanes

Entimint—for an area cleared of mines.

Minefields are marked with vertical lettering, dummy minefields with slanting letters. This distinction, however, is supposed to be made known only to the German engineer troops because other troops may divulge the location of dummy minefields by crossing them.

#### 5. Mine Plans, Sketches, and Reports

A German mine plan shows one or more fields in all necessary technical details. A German mine map, on the other hand, shows all mine obstacles within one front sector and their tactical significance, but without technical details.

The Germans use a number of different forms for their reports and sketches, although all are based on the same principle. Figure 17 shows a very commonly used form. The upper third of the mine map form provides space for written specifications and a small situation sketch. The drawing is made on the blank space provided. It is the engineers' responsibility to draw up mine maps, and to keep them up to date. Additional remarks sometimes are placed on the back of the sheet.

- a. DETAILS OF MINE MAP. The German mine map usually shows the following details:
- (1) Name of the obstacle and designation of the unit which laid it.
- (2) Name of the area in which the obstacle is located.
- (3) Grid reference and particulars of the map sheet referred to.
  - (4) Obstacle shown in the little sketch in red.
  - (5) Date minefield was laid.
- (6) Name and rank of officer or noncommissioned officer in charge of laying field.

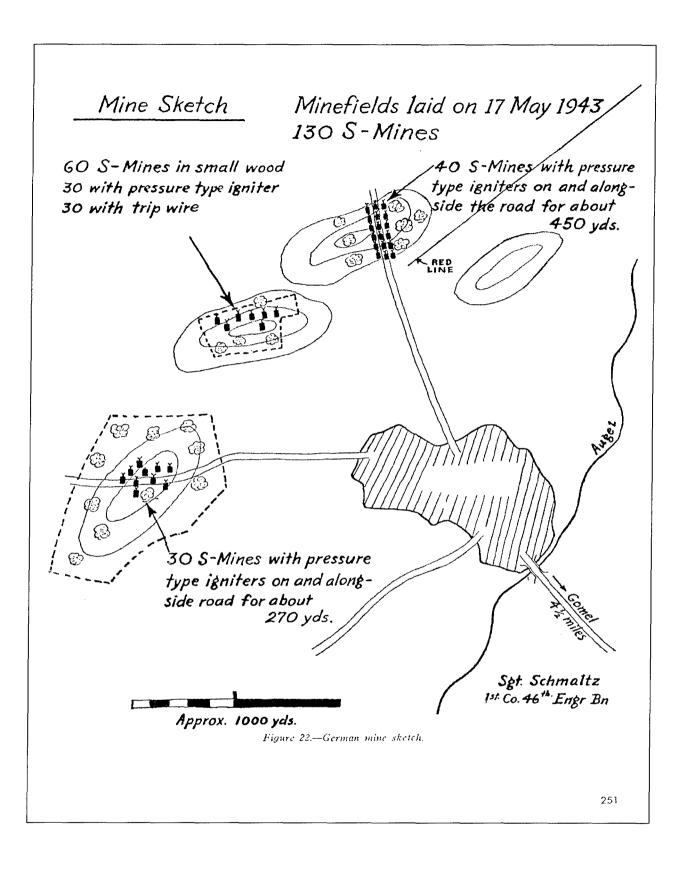

- (7) Day of survey and instrument used (old or new compass—German issue).
- (8) Name and rank of officer or noncommissioned officer in charge of survey.
- b. Mine Data in Map. The following data are given on the mines:  $\label{eq:map}$
- (1) Number, type and igniter. (Example: 72 T-Mine with *T-Mi.Z. 42*, booby-trapped.)
  - (2) Whether or not the mines are dug in.
- (3) Number of rows, and number of mines per row.
- (4) Fence (Example: warning fence on friendly side.)
- (5) Special features (Example: destroyed enemy tank in center, on enemy side.)
- c. Minefield-Type Identification in Map. Colored lines drawn diagonally across the upper right-hand field of the mine map identify the type of the minefield as follows:
- (1) A red diagonal line designates fields which cannot be cleared because some or all mines are booby-trapped.
- (2) A yellow Cagonal line designates fields which can be cleared by using data from mine document,
- (3) A green diagonal line designates dummy minefields.
- (4) Mines taken up or exploded are marked in red.

The number of the minefield plan and unit designation appears on the upper right-hand corner of the sheet. Battalion, regiment, and division engineers make their notes in the space provided for them.

For S-Mines laid 50 meters (55 yards) from the German lines, a note is made in red letters: VORSICHT, NUR 50 METER ABSTAND! (Caution, only 50 meters distance!)

In case electrical ignition is provided, a note is made showing how the igniters will be disposed of, if the unit which has laid the minefield is relieved.

- d. Information in Minefield Drawing. The drawing of the minefield is made in the blank space on the lower part of the sheet. The scale is from 1:500 to 1:2,000 whenever possible. The following information is included:
  - (1) Shape and size of minefield.
  - (2) Pattern.
  - (3) Location of hooby-trapped mines.
- (4) Location of survey points with azimuth and distances.
  - (5) Type and location of warning fence.

Built-in hidden charges

Survey points (VP) and Fix points (FP)

-w-w-w- Warning fences

Direction of enemy attack

- (6) Location of the front lines and fortifications.
- (7) Neighboring minefields, mine lanes, terrain features, special features.

The Germans believe that it is not necessary to mark on the minefield drawing the location of every single mine, if a partial drawing is sufficient. The German mine plans contain the detail symbols shown in Figure 18, while simple tactical signs are sufficient for minefield maps.

The Germans complete their mine plans at company or battalion command posts, based on sketches and data compiled while the field is being laid out. They make five copies of all mine plans and distribute them as follows: One for engineer company which is in charge of the minefield: two for division; one for army; one for central file in Dessau-Rosslau.

Changes in the minefield are recorded on the back of the mine plan. After three changes a new mine plan is drawn.

A mine sketch is a simplified mine plan used to transmit information on a minefield as rapidly as possible. It is not drawn to scale, and is drawn whenever the tactical situation, bad weather, or other circumstances prevent the preparation of mine plans.

Front-line troops receive from the engineers instructions or sketches showing the approximate location and extent of the minefield. These sketches, as a rule, do not contain details on types of mines or igniters, pattern, and survey points.

Engineer units in charge of minefields keep records of changes in minefields under their care and keep these records with their units, while mine plans are turned over to the relieving units.

- e. MINE REPORTS. Armies generally designate certain areas for fields of scattered mines. In this case mine reports take the place of mine plans. Normally, mine reports contain:
- (1) Number of the order authorizing scattering of mines.
  - (2) Designation of units scattering the mines.
- (3) Name and number of field containing scattered mines.
  - (4) Map location of scattered minefield.
- (5) Number of mines scattered, subdivided by types and igniters.
- (6) Number and type of booby-trapped mines, kind of booby trap.

# Appendix G, Annex 1 German Mines and Fuzes

### A) GERMAN ANTI-TANK MINES

Tellermine 35 (T.Mi.35)

This steel mine is 31.7 centimeters in diameter and 8.2 centimeters high. The large, circular, steel pressure plate has a spring between it and the mine body. This spring is placed in the centrally located main fuze well. It has two secondary fuze wells. One is located in the side directly across from the carrying handle and the other is located in the bottom in the center.

# Characteristics.

Shaye	Fuze		Explosive		
		Operating force	Main charge	Booster	
Circular	<b>3</b> 5	200 to 400 lb. prce- sure.	11 lb. TNT or 65/35 amatol or 50/50 tetrytol.	9 oz. Penthrite. (PETN/TNT 50/50).	
Fuse bazarda			Ren	nrks	

Use. The Tellermine 35 is used as an antitank mine. This mine may be found encased in a waterproof jacket.

A pressure bar to interconnect

mines may be used.

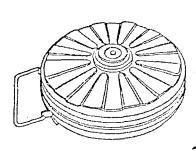

Functioning. Pressure on the pressure plate is transferred to the top of the fuze. This pressure forces the striker-shaft down, shears on the shear pin, and fires the percussion cap. The percussion cap in turn fires the detonator, booster, and mine.

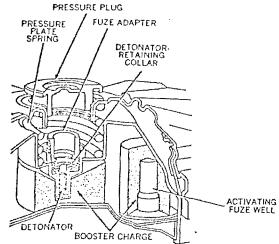

Installing and Arming.

- Place the mine in a hole with the carrying handle in the horizontal or down position.
- (2) Unscrew the wooden shipping plug from the main fuze well and insert a detonator in the fuze well.
- (3) Screw in the threaded washer to hold the detonator in place and then screw in the adjusting collar (a special wrench is provided for this and the threaded washer).
- (4) Place the rubber or leather washer in the groove of the adjusting collar.
- (5) Screw the Tellermine fuze 35 into the main fuze well until it bears on the rubber or leather washer.
- (6) If a secondary fuze is used, screw any pull fuze with standard threads into the secondary fuze well.
- (7) Turn the screw head arming dial in the top of the Tellerfuze 35 so that the red dot points to scharf (armed).
- (8) Pull out the safety bolt by the wire attached to the safety bolt claw.

- (1) Check for and remove any secondary fuzes or antilift devices.
- (2) Carefully press in the safety bolt. If it does not move easily, do not force it.
- .(3) Carefully unscrew the fuze from the mine.
- (4) Separate the detonator from the fuze. Turn the arming dial to sicher (safe).
- (5) Transport the mine and fuze to a safe storage or disposal area.

Tellermine 35 (Steel) (T.Mi.35 [Steel])

This steel mine is 31.7 centimeters in diameter and 8.8 centimeters high. It differs from the Tellermine 35 by having a fluted pressure plate to keep the sand from blowing off in desert areas. It has one centrally located main fuze well that is hidden by a pressure plug when either the Tellermine 42 or 43 fuze is used, but is not used with the Tellermine 35 fuze. One secondary fuze well is located in the bottom of the mine case directly in line with the carrying handle, and another in the side of the mine case in the vicinity of the carrying handle.

Characteristics.

Shape				Explosive	3	Sec.
Suvi.	Fuse		Operation force	Main charge	Booster	ondary fure wells
Circular	T.M T.M T.M	42	200 lb. pres- sure.	12 lb. TNT	9 oz. pen- thrite (penthrite is PETN/ TNT 50/ 50).	2
Fuso hexards		Markings		Remark	4	
Percussion .	cap.	"T.Mi.35/ Z." 42" i			Lugs are ad late mod attaching wires.	els for

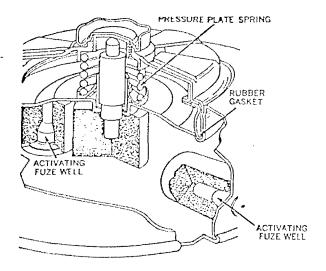

Use. This mine used as an antitank mine in desert areas. It may also be encased in an earthenware waterproof jacket.

Functioning. Pressure on the pressure plug or the pressure plate is transmitted to the top of the fuze. This forces the striker shaft down, shears the shear pin, and fires the percussion cap, detonator booster, and the mine.

Installing and Arming.

- (1) Tellermine fuze 35.
  - (a) Place the mine in the ground.
  - (b) Unscrew the pressure plug from the main fuze well and insert a detonator. The pressure plug is not used.
  - (c) Screw in the threaded washer to hold the detonator in place and then screw in the adjusting collar. A special wrench is provided in the fuze packing box for screwing in the threaded washer and the adjusting collar.
  - (d) Place the rubber or leather washer in the groove of the adjusting collar.
  - (e) Screw the Tellermine fuze 35 into the main fuze well until it bears on the rubber or leather washer.
  - (f) If a secondary fuze is used, screw any pull fuze with standard threads into a secondary fuze well and arm as specified.
  - (g) Turn the screw head arming dial in the top of the Tellermine fuze 35 so that the red dot points to scharf (armed).
  - (h) Pull the safety bolt out by the wire attached to the safety bolt claw.

## Tellermine 42 (T.Mi.42)

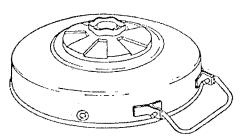

This steel mine is 32.2 centimeters in diameter and 10.1 centimeters high. It has a circular steel pressure plate 15.2 centimeters in diameter. A scalloped pressure plug in the center of the pressure plate covers the main fuze well. There are two secondary fuze wells—one in the side of the mine case close to the carrying handle, the other in the bottom of the mine case slightly off-center in the direction of the carrying handle.

Characteristics.

Shape	Fure	Operating force	Explosive		Bec-
			Main charge	Booster	londary fure wells
Circular	T.Mi 42 or T.Mi 43	250 to 400 lb. pres- sure.	12 lb. TNT	12 oz. PETN/ Wax 91/9 (approx).	2

Fuze bezarda	Markings .
Percussion cap, and two secondary fuze wells.	Manufacturer's date and number in white on the top.

Usc. This antitank mine is laid in roads and minefields.

# Functioning.

- (1) Tellermine fuze 43. Pressure applied on the pressure plate forces the pressure sleeve down, shearing the main shear pin, then permitting the retaining balls to escape and releasing the striker against the percussion cap. Pressure release action is initiated by the unscrewing of the hexagonal pressure plug, which releases the striker against the percussion cap.
- (2) Tellermine fuze 42. Pressure on the pressure plate shears the shear pin, releasing the striker against the percussion cap.

# Installing and Arming.

- (1) Place the mine in the ground with the carrying handle horizontal or down.
- (2) Unscrew the hexagonal pressure plug from the main fuze well.
- (3) Screw detonator retaining collar with detonator to the fuze.
- (4) Insert the fuze with detonator into the main fuze well.
- (5) Screw in the hexagonal pressure plug. If the Tellermine fuze 43 is used, screw the hexagonal pressure plug down until a click is heard. This assures that the fuze is armed.

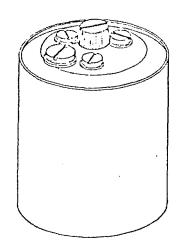

Disarming Procedure. Do not attempt to disarm this mine, as the pressure plug cannot be removed in order to identify the fuze. Blow the mine in place.

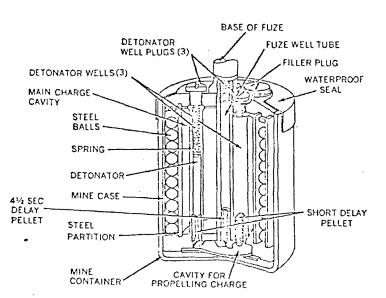

Additional Precautions. If for any reason the mine cannot be blown in place, check for and remove any secondary fuzes or antilift devices and carefully pick up the mine and carry it to the closest safe disposal area.

# B) GERMAN ANTI-PERSONNEL MINES

# B) GERMAN ANTI-PERSONNEL MINES

S-Mine 35 (S.Mi.35)

This is a steel cased mine 10.1 centimeters in diameter and 12.7 centimeters high. It has a pressure fuze, detonator, main charge, propellant charge, and a 4½—second delay pellet, which permits the mine to jump about 1 meter into the air before it explodes, scattering its 300 to 350 steel balls or shrappel in all directions.

# a. Characteristics.

٠		_	Explosive		
Shape	Fuzo	Operating force	Main charge	Propelient	
Circu- lar	S.Mi.Z-35 and E.S. Mi.Z-35 pressure; Z.Z-35 and Z.U. Z.Z-35 pull.	4 to 5 lb.	8 to 14 oz. cast or powdered TNT.	20 grms. black powder	

b. Use. This mine is laid as an antipersonnel obstacle, either singly or in groups of 2 to 5 mines, with one pressure fuze or 2 or 3 fuzes and rigged with tripwires or with an electrical circuit with up to 8 electric fuzes laid around the mine in parallel.

Functioning. Ignition of the fuze sets off the 4½-second delay pellet. The pellet ignites the propelling charge which projects the mine upward and at the same time ignites the short-delay pellets. The short-delay pellets set off the detonators and main charge when the mine is from 1 to 1½ meters in the air.

Installing and Arming.

- Remove the three screw plugs from the detonator wells and insert three detonators OPEN END DOWN.
- (2) Replace screw plugs.
- (3) Remove fuze-well plug and screw in a pressure fuze (or a Y or W adapter for two or three pull and/or pressure fuzes).
- (4) Place mine in a hole so that the ends of the pressure prongs or pull rings are just above ground livel.

Disarming Procedure.

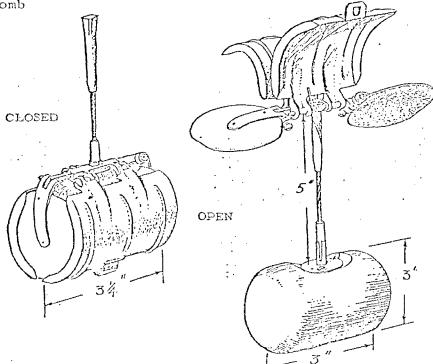

- (1) Pressure fuze: Insert a nail or other safety pin through the safety-pin hole in the fuze and unscrew the fuze from the mine. Unscrew the detonator well plugs and slide the detonators out of the mine.
- (2) Pull fuzes and trip wires. Trace and cut all slack trip wires attached to fuzes and unscrew fuzes from the mine Remove detonators.

Note. If a taut trip wire is attached to one of the fuzes, DO NOT CUT IT but insert a safety pin through the safety-pin hole in the fuze first, then cut the wire and proceed as above.

(3) Remove the mine and fuzes to a safe storage or disposal area.

Additional Precautions. Some, but not all, models of this mine have a supplementary fuze well in the bottom for inserting a pull fuze for boobytrapping purposes.

German Butterfly Bomb

TYPE. Antipersonnel bomb

COLOR. Green-gray

CASE. Sheet metal

WEIGHT. 41/2 pounds

EXPLOSIVE, Yellow TNT (7.5 oz.)

EFFECT. Causes casualties within a radius of 50 feet

EMPLOYMENT. Dropped from low-flying aircraft.

### PACKING AND TRANSPORTING

Container holds 23 bombs.

# CAUTION

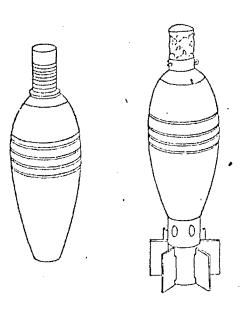

Three types of fuze have been found in bomb. In 41 fuze, selector screw can be set at ZEIT to explode bomb 3 seconds after arming, or at AZ to explode on impact. Clockwork in 67 fuze is adjustable for delays of 10, 20, or 30 minutes. ZEIT and AZ often are stamped on this fuze for deception. Fuzes 70 (A) and 70 (B) are antihandling devices, probably similar in action to that in Italian thermos bomb. Bombs extremely dangerous when armed with them.

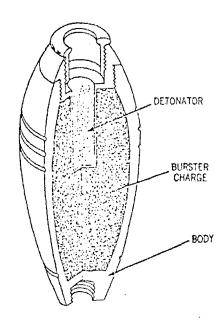

### **FUNCTIONING**

- 1. Container holding 23 bombs opens after falling predetermined distances, allowing bombs to scatter.
- 2. Springs force apart two halves of bomb case.
- 3. Halves of case and two butterfly vanes move to top of spindle wire, arming bomb.
- 4. Bomb explodes at predetermined time, on impact, or when handled, depending on type of fuze installed.

# DEFUZING

If case still is closed, bomb is unarmed and fuze may be removed. If bomb is armed, wait 45 minutes To destroy bomb, build sandbag wall around it and, from behind sandbags, pull bomb with rope; or, set off small charge next to it.

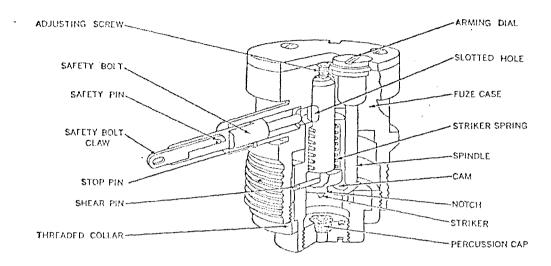

a. Description. The improvised antipersonnel mine W-1 is made from a French 50-mm mortar shell. The tail fins and the nose fuze are removed. A Buck chemical fuze is inserted in the nose by means of a plas-

is inserted in the nose by means of a plastic adapter.

- b. Employment. This mine is used in antitank mine fields to hinder reconnaissance and breaching parties. It is laid in paths, ditches, and other places where foot soldiers are most likely to walk.
- c. Functioning. A pressure of about 15 pounds crushes the corrugated aluminum cylinder of the Buck chemical fuze, exploding the mine.

# C) GERMAN MINE FUZES

Pressure Fuze T.Mi.Z.35

Section of T.Mi.Z.35 (see page 1 for overall of markings)

#### Characteristics.

Sinking	Cuse	Internal action	force	Remarks
Cylin- drical	Brasa	Mechanical, with shear pin release.	250 to 400 lb.	In disarming mines containing thi fuze, the dia indications sicher and scharf should be disregarded, as they have been known to be purposely in error.

Employment. This fuze was designed especially for use in the Tellermine 35.

This Tellermine fuze is 5.3 centimeters high and 4.0 centimeters in diameter. It is composed of a case that contains a spring-loaded striker fastened by a shear pin to a cylindrical housing loosely retained in the fuze case by a threaded collar. The percussion cap screws into the base of the striker housing. The fuze has two safety devices—a horizontal safety bolt that passes through a hole in the striker, and a rod

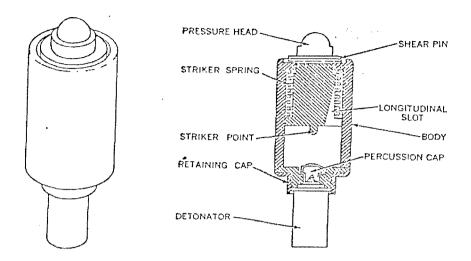

attached to a slotted screw head on the arming dial in the top of the fuze, with a cam at the lower end. When the screw head is turned to sicher (safe), the cam engages the striker and takes the pressure of the striker spring off the shear pin. When the screw head is turned to scharf (armed), the cam is disengaged from the striker.

Functioning. After arming, proper pressure on any part of the lid of the mine will move the igniter body downward until it ruptures the shear pin, which permits the spring to force the striker against the percussion cap to undertake the firing chain.

Installing and Arming.

- (1) Screw the fuze into the fuze well of the mine.
- (2) Turn the setting dial counterclockwise until the red spot is opposite the red line under scharf.
- (3) Withdraw the safety bolt until it is latched by the stop pin.

Disarming Procedure. Unscrew the fuze from the mine and remove it to a safe storage or disposal area.

External and sectional view of T.Mi.Z.42 pressure fuze

This is a Tellermine fuze with a body 5.2 centimeters long and 2.1 centimeters in diameter, bored to receive the striker, striker spring, and detonator cap housing. The striker is domeshaped at the upper end. The lower end has a collar that forms a seat for the striker spring. A longitudinal inclined slot is machined in the lower end to prevent air cushioning. A retaining cap, screwed to the detonator cap housing, holds the detonator in a central position.

Characteristics.

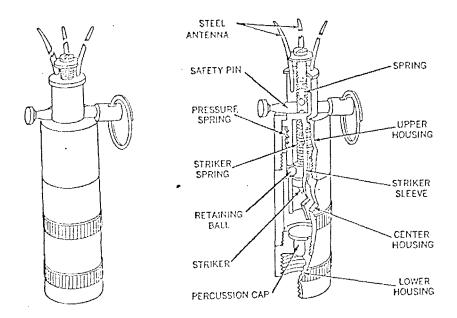

Shape	Caso	Internal action	Operating force
Cylindrical	Steel	Pressure me- chanical, with shear pin release.	250 to 400 lb.
	1		

Use. This igniter was designed to actuate the steel Tellermine 35, Tellermine 42, and mushroom Tellermine 43. The fuze has non-standard German threading.

Functioning. Pressure applied to the striker head breaks the shear pin and releases the striker to fire the percussion cap and initiate the firing train.

Installing and Arming. As this fuze has no safety, installing and arming are no more than to screw the detonator retaining collar with the detonator to the base of the fuze and insert the assembly into the mine.

- (1) Remove the fuze from the mine.
- (2) Unscrew the detonator retaining collar from the base of the fuze and remove the detonator.
- (3) Remove the fuze to a safe storage or disposal area.

The S.Mi.Z. 35 is a prong-topped pressure fuze in three parts—upper housing, center housing, and lower housing. The upper housing contains the pressure spring and plunger which has three prongs attached to its upper end. The central housing serves as a guide for the plunger; and the lower part contains the percussion cap and threads for attachment to the mine. The fuze is 9.5 centimeters long and 1.8 centimeters in diameter.

Characteristics.

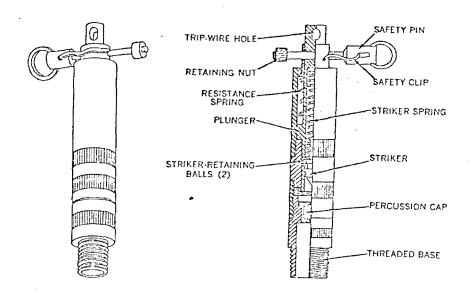

Shape	Case	Internal action	Operating force
Cylindrical	Aluminum	Pressure mechanical, with ball release.	8 to 10 lb.

Use. This is a specially designed fuze for the S or bounding mine. Usually the tips of the prongs or antennae extend above the ground.

Functioning. Pressure applied on the prongs overcomes the resistance of the pressure spring and depresses the plunger. At a certain point, this depression frees the retaining balls and releases the striker, which is then driven into the percussion cap. This fires the percussion cap and continues the firing chain.

- Installing and Arming.
- (1) Screw the fuze into the mine.
- (2) Place the mine in the ground.
- (3) Unscrew the retaining nut from the end of the safety pin and withdraw the safety pin.

- (1) Insert a nail or wire in the safetypin hole.
- (2) Remove the fuze from the mine and unscrew the percussion cap.
- (3) Take the fuze to a safe storage or disposal area.

The body of this fuze is in four parts: the main housing; the guide piece, which is screwed to the main housing; the space piece; which is screwed to the guide piece; and the lower piece, which is screwed to the space piece. The main housing contains the sliding cylinder and the compression spring. Within the sliding cylinder are the striker spring, the striker, and the two retaining balls that hold the striker in place. The lower piece contains the percussion cap. The fuze measures 7.2 centimeters in length and 3.0 centimeters in diameter.

Characteristics.

Shape	Caso	Internal action	Operating force
Cylindrical	Brass	Mechanical, with locking pin release.	15 to 20 lb.

Use. This fuze is the standard igniter for S-mine and prepared charges, boobytrapping Tellermine, and boobytraps with tripwires. The threaded base fits all standard charges, grenades, and mines.

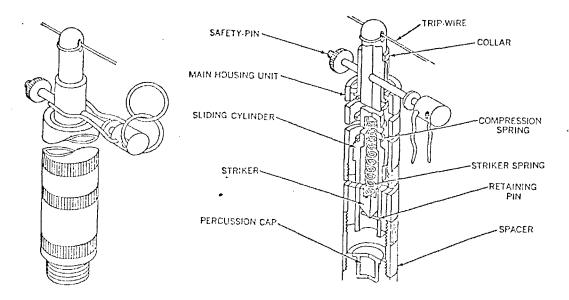

Functioning. A pull on the tripwire pulls the plunger upward against the resistance of the compression spring. The two locking balls

are forced outward, when they come opposite to the open spaces, releasing the striker. The striker then, under the force of its spring, sets off the percussion cap.

Installing and Arming.

- (1) Insert a standard detonator in the base of the fuze.
- (2) Screw the fuze into the mine or charge.
- (3) Attach a slack tripwire to an anchor and then to the hole in the top of the fuze.
- (4) Unscrew the retaining nut from the end of the safety pin and remove the safety pin.

- (1) Insert a wire or nail in the safety pin
- (2) Cut any slack tripwires and remove the fuze from the mine or charge. (Taut wires must be checked first.)
- (3) Separate the percussion cap and detonator from the fuze.
- (4) Take the fuze to a safe storage or disposal area.

This fuze has a spring loaded striker with a pin release. It has four parts, the main housing with the sliding cylinder and compression spring, the guide piece, the spacer piece, and the lower piece, which contains the percussion cap. At the top of the sliding cylinder is a hole for tying the tripwire or tension wire. The length of the fuze is 11.0 centimeters; and the diameter, 1.2 centimeters.

## Characteristics.

Shape	Carc	Color	Internal action	Operating force
Cylin- drical.	Brass	Field gray.	Mechanical with taut tripwire and locking pin release.	9 to 13 lb.

Functioning. A pull on the taut trip wire pulls out the sliding cylinder against the resistance of the compression spring. This also forces the retaining pins into the upper open space and frees the striker. Cutting or breaking the trip wire permits the compression spring to force the sliding cylinder downwards, freeing the retaining pins into the lower open space and releasing the striker. In both cases the freed striker hits and fires the percussion cap.

Use. This type of igniter is generally installed in mines and charges actuated by wires in tension.

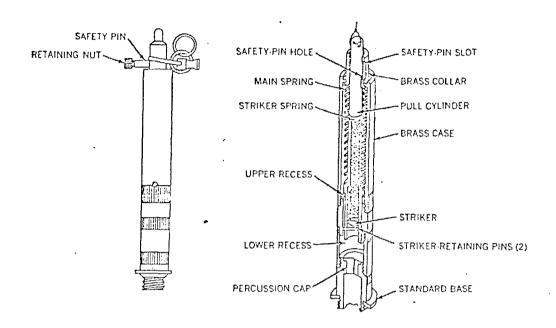

Installing and Arming.

- Insert a detonator into the base of the fuze.
- (2) Screw the fuze into the mine or charge.
- (3) Attach a taut tripwire to an anchor and to the safety pin hole.
- (4) Unscrew the retaining nut from the end of the safety pin and remove the safety pin.

Note. This igniter proves so dangerous to use that a number were returned to the factory and modified. In these, the tension release feature was removed by cutting the trip wire slot from the end of the sliding cylinder and attaching the tripwire to the safety pin.

- Cut any slack trip wires and wire or tape the safety pin or nail or wire securely in place.
- (2) Unscrew the fuze from the mine and remove the detonator.
- (3) Take the fuze to a safe storage or disposal area.

# Modified Z.u.Z.Z.35 (functions on pull only)

The modified fuze is identical with the pulltension-release fuze 35 except that the tripwire hole at the end of the pull cylinder is cut off. This prevents the fuze from functioning by tension-release and permits functioning only by pull.

Characteristics.

Shape	Case	Internal action	Operating force	Marking
Cylin- drienl.	Metal	Mechanical, with pull pin and retaining pin release.	40 lb (approx).	NUR ZUG- ZUNDER stamped on the case.

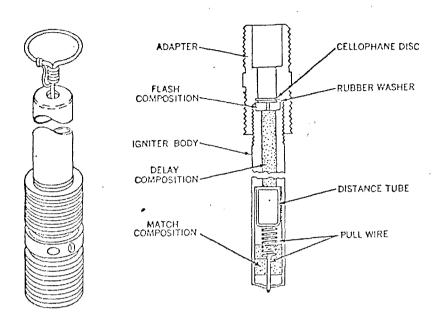

Use. This fuze has a variety of uses—in the stake mine, S-mines, side fuze wells of Tellermines, and boobytraps with pull wires.

Functioning. A tug on the tripwire pulls out the safety pin. The pull cylinder, under pressure of the main spring, then moves downward until the striker retaining pins escape into the lower recesses, releasing the spring-loaded striker to fire the percussion cap and detonator.

Installing and Arming.

- (1) Insert a detonator in the base of the fuze and screw the fuze into the mine or charge.
- (2) Attach a slack tripwire to an anchor and to the safety pin ring.
- (3) Unscrew the retaining nut from the end of the safety pin.

- (1) Cut any slack tripwires.
- (2) Wire or tape the safety pin securely in place.
- (3) Unscrew the fuze from the mine.
- (4) Separate the detonator from the fuze.
- (5) Remove the fuze and mine to a safe storage or disposal area.

The body of this friction fuze has a wall of two thicknesses forming a shoulder on which rests the distance tube that prevents the longitudinal movement of the coated part of the pull wire. The 7-second delay composition is black powder covered with a small quantity of flash compound. The whole filling is protected by a cellophane disk held in place by a rubber washer. The fuze is 7.6 centimeters long and 0.6 centimeters in diameter.

# Characteristics.

Shape	Case	Internal action	Operating force
Cylindrical	, Aluminum	Pull-friction	20 lb (approx).

Use. The BZ-39 fuze is used primarily in hand grenades, but is adaptable to use as a pull fuze in Tellermines, S-mines and boobytraps.

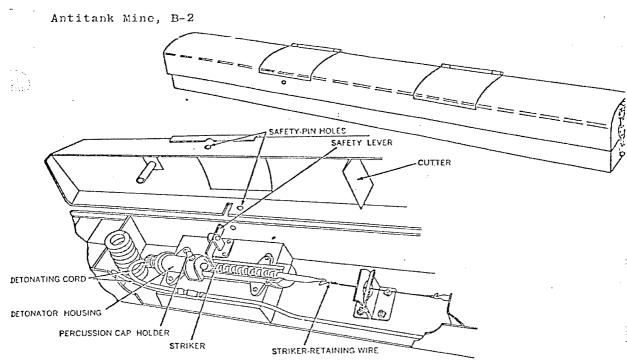

Functioning. The coiled part of the pull wire is drawn through the friction compound, producing a flash that ignites the delay composition, which after 7 seconds sets off the grenade or mine.

Installing and Arming.

- Attach a detonator to the base of the fuze.
- (2) Place the fuze and detonator into the mine charge or boobytrap.
- (3) Attach a pull wire.
- Disarming Procedure.
- (1) Remove the fuze from the mine, charge, or boobytrap.
- (2) Separate the detonator and fuze.
- (3) Remove the fuze and mine or charge to a safe storage or disposal area.

# Appendix G, Annex 2 Italian Mines

### A) ITALIAN ANTI-TANK MINES

The Italian B-2 and Spanish B-2 antitank mines are almost identical. They consist of a metal case, 106, 66 by 12.7 by 12.7 centimeters, with a detachable lid or pressure cover supported on two coil springs. The two fuzes are retained cocked by a retaining wire that is sheared by a cutter fastened to the under side of the pressure cover. The two explosive charges are placed one at each end.

Characteristics.

Shape	Fuze	Operating	Explosive
Rectangular	Integral, pull.	300 lb. or more.	6 lb.

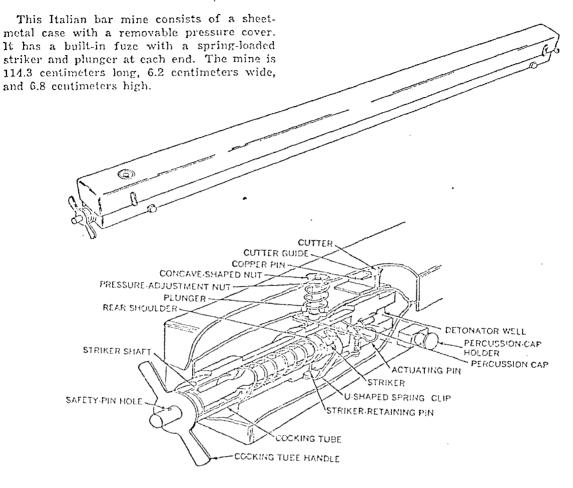

Use. This mine is used against tanks. It must be emplaced at a distance of at least 2 meters between mines, to avoid sympathetic detonation.

Functioning. Pressure on the pressure cover moves it downward against the compression springs, clearing the safety levers from the strikers and cutting the retaining wire. This releases the strikers to fire the mine.

#### Installing and Arming.

- (1) Remove the cover.
- (2) Cock the striker by turning the wire tensioning nut in a clockwise direction until the safety lever falls into the notch in the striker.
- (3) Insert the safety pin into the hole through the side of the mine and into the fuze case.
- (4) Screw on the detonator and attach the detonating cord.
- (5) Insert the percussion cap holder into the hole in the housing in front of the detonator.
- (6) Replace the detachable cover, cover the mine with earth, and from a safe distance, withdraw the safety pin.

- Check for and remove any antilift devices.
- (2) Carefully lift the mine cover.
- (3) Insert a safety wire through the safety-pin hole in the side of the mine
- (4) Cut the detonating cord at the fuze end and unscrew the percussion cap holder.
- (5) Unscrew the detonator from the fuze.
- (6) Allow the striker to go forward.
- (7) Transport the mine and fuze to a safe storage or disposal area.

# Characteristics.

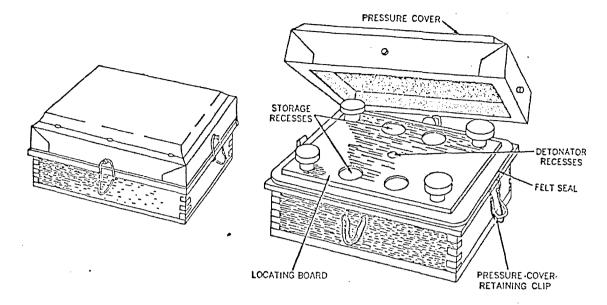

Shape	Fuzc	Operating force	Explosive
Rectangular	Integral	204 lb. antitank 22 lb. antiper- sonnel.	6 lb.
g. 16, pp	Rem	arks	

If the copper pin is left out and the pressure adjustment nut is not used, it becomes an antipersonnel mine.

Use. This mine is usually laid in road blocks and at road junctions because of its large-area coverage.

# Functioning.

- Pressure on the pressure cover forces the cover downward causing the cutter to cut the copper pin in the cutter guide.
- (2) The plunger in one or both fuzes is depressed against the resistance of the coil spring onto the actuating pin, which in turn depresses the Ushaped spring clip.
- (3) The U-shaped spring clip then depresses the striker retaining pin end of the flat retaining spring, releasing the striker to fire the percussion cap and the mine.

This is a wooden box-type unit with four plastic fuzes, but with enough metal to make it detectable. It has three parts—a box for the explosive, a frame to support the pressure board, and the pressure board. The top is covered with cloth painted or dyed in a camouflage pattern. This mine is no longer produced, but will remain in service until present stocks are consumed. The mine measures 34.0 by 28.9 by 16.0 centimeters.

Characteristics.

· Shape	Fuze	Operating force	Explosive
Rectangular box.	Pressure	220 lb. (approx).	11.0 lb. TNT in cartridge form —25 7 oz. cartridges.

Use. It is laid in pattern in minefields to damage tracks of armored vehicles by concussion. By the substitution of the Model PMC 43 button type fuze for the Model 42/2 pressure fuze and by weakening the pressure board supports so that they fail under a man's weight, it may be converted to an antipersonnel mine.

Functioning. Pressure on the top breaks the fragile supports of the pressure board and forces it down on the fuzes, actuating them and detonating the mine.

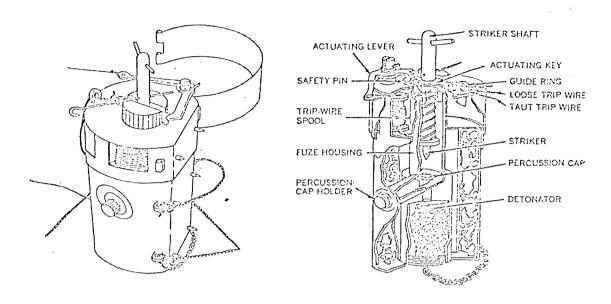

Installing and Arming.

- (1) Remove the lid.
- (2) Remove the four wooden cylinders (false fuzes) from the fuze wells.
- (3) Remove the fuzes from their transport recesses.
- (4) Attach OTO detonators to the fuzes (42/2) and place the fuzes in the wells.
- (5) Replace and lock the lid on all four sides.

- (1) Check for and remove any antilift devices.
- (2) Remove the lid and the fuzes from the fuze wells.
- (3) Separate the detonators from the fuzes.
- (4) Remove the mine and fuzes to a safe storage or disposal area.

#### **B) ITALIAN ANTI-PERSONNEL MINES**

Antipersonnel Mine, B-4 German nomenclature: Reisz-(Stolper-)Mine B-4

The B-4 is composed of two concentric steel cylinders with a common base and superimposed top cover. The mine is 6.8 centimeters in diameter and 12.9 centimeters high. In the flattened portion of the outer cylinder are six spikes for fastening the mine against a tree or post. A percussion-cap holder is inserted diametrically through the side of the mine case. The detonator and booster are inserted in a well in the bottom of the fuze housing. Tripwires, wound on spools, are carried in recesses in the top portion of the case and covered by a hinged flap closed by a pin. This pin also serves as a safety pin for arming the mine. On some models, an auxiliary firing mechanism is provided-a spring-loaded actuating lever held cocked by a taut tripwire.

Characteristics.

Shape	Fure	Operating force	Explosive
Cylindrical flattened on one side.	Integral pull	10 to 20 lb	0.25 lb. TNT.

Usc. This mine is employed in antitank minefields in an irregular line in the front. It may also be found in antipersonnel minefields and wire obstacles along with other mines.

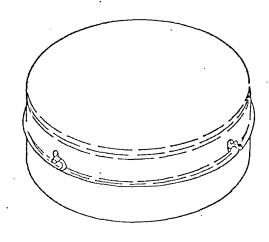

Functioning.

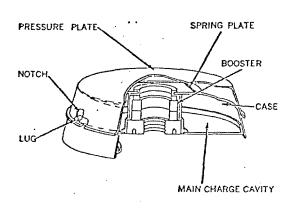

- (1) With slack tripwire. A pull on the slack tripwire pulls the actuating key away from the striker shaft permitting the striker shaft to slip through the circular hole in the actuating key. The released striker then sets off the percussion cap and fires the mine.
- (2) With taut tripwire. The cutting or breaking of the taut trip wire releases the spring-loaded actuating lever against the actuating key. The actuating key is then pushed outward until the striker shaft slides through the circular hole in the key. After this the released striker sets off the percussion cap and fires the mine.

# Appendix G, Annex 3 British Mines and Fuzes

# A) BRITISH ANTI-TANK MINES

Mine, A.T.Mk II.
German nomenclature: Pz.Mi.402(e)

a. Description. The British G. S. (general service) antitank mine, Mark II consists of a steel case, 71/2 inches in diameter and 31/4 inches high, with a rounded top and a flat bottom. The case is dark green in color, except for the bottom, which is yellow with a red and green cross. The fuze well is centrally located in the bottom of the case and is surrounded by a booster charge. Two filler plugs are also located in the bottom of the case. This mine uses the pressure fuze, antitank, No. 1, Mark I A pressure cover fits over the case, and is held in place by four locking cover pins on the side of the case. 'A springlike plate riveted to the underside of the cover exerts a light pressure on the case so as to hold the cover firmly against the locking cover pins. The mine weighs a total of \$.25 pounds, including 4 pounds of explosive.

b. Employment. This mine is employed against vehicles and light tanks in tactical and hasty mine fields and in road blocks.

### c. Functioning.

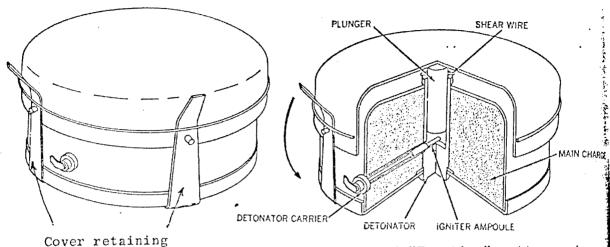

- (1) A pressure of 350 pounds, or more, on the pressure cover crushes the brass pressure cap of the fuze.
- (2) The pressure head and the plunger of the fuze are forced down, pushing aside the four prongs on the brass safety sleeve and compressing the striker spring.
- (3) The striker-retaining balls are forced outward into a recess in the plunger, releasing the spring-loaded striker against the percussion cap and firing the mine.

#### d. Installing and Arming.

- (1) Unscrew the shipping plug from the fuze well in the bottom of the mine.
- (2) Insert the fuze in the fuze well and screw it in finger-tight.
- (3) Place the mine in a hole so the cover is flush with the surface of the ground.

#### e. Neutralizing.

- (1) Search for and neutralize any activating fuzes.
- (2) Unscrew the fuze from the bottom of the mine.

Section of "Egyptian" pattern mine

This antitank mine consists of the steel mine body, mine cover, and mine fuzing arrangement. The mushroom-shaped mine cover is attached by four hooked straps. The mine has a central fuze well. On the side near the base is a channel that leads to the central well, which is closed by a small metal tab during shipment and storage. The fuze (E.P. Mark 2) consists of a plunger inserted into the central well and retained by a shear pin, and a detonator and ampoule cartridge inserted in the side channel. The mine is 25.4 centimeters in diameter and 10.1 centimeters high.

Characteristics.

straps

Share	Fuse	Operating force	Explosive	Remarks
Mush- room	Integral, per- cussion type.	200 lb. (ap- prox).	4 ½ lb.	Once laid, these mines should not be used again, even if disarmed.

Use. This mine is used in defense against armored cars, tanks, and other vehicles.

Functioning. Pressure on the mushroom-shaped top forces the plunger through the shear pin and down against the ampoule cartridge, crushing it and causing a chemical reaction that fires the detonator.

# Installing and Arming.

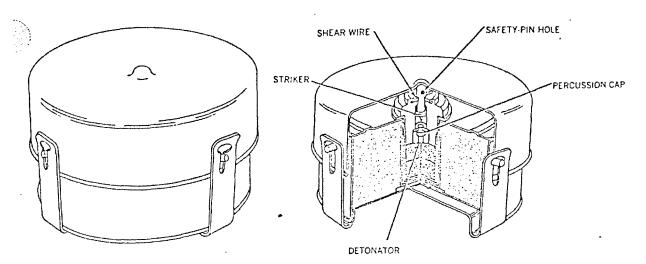

- (1) Insert the ampoule cartridge, red end first into the open end of a detonator No. 8 and seal with luting.
- (2) When ready to lay the mine, remove the steel rod from the hole in the mine body and insert the detonator assembly, ampoule end first, without using force.
- (3) Bend the tab over the end of the assembly and place the mine in the ground.

#### Disarming Procedure.

- Check for and remove any antilift devices.
- (2) Remove the wire holding the mine cover in place and remove the mine cover.
- (3) Remove the plunger from the mine.
- (4) Loosen the metal tab which covers the detonator assembly on the side of the mine case and carefully remove the detonator assembly.
- (5) Destroy the detonator assembly.
- (6) Transport the mine to a safe storage or disposal area.

Additional Precautions. If the detonator assembly does not come out easily, destroy the mine in place.

Mine, A.T.Mk III. German nomenclature: Pz.Mi.403(e)

Section of Mine, A.T.Mk III

This steel mine is 15.2 centimeters in diameer and 12.8 centimeters high. It has a flatsurfaced circular steel pressure cover that fits loosely over the top of the mine case and is raised slightly in the center to form a pocket for the plunger of the fuze. The Germans manufactured a pressure igniter, the Mi.Z. 530, (e) to be used in this mine, which was an almost exact copy of the No. 2 Mark 1.

Characteristics.

Shape	Fuze	Operating force	Explosives	
			Main charge	Booster
Circular	Contact No. 2, Mark 1.	350 lb. pres- sure.	4.5 lb. TNT (approx).	CE pellet (CE is Tetryl).
Fure b	brard			
Detonator a	ssembly.			

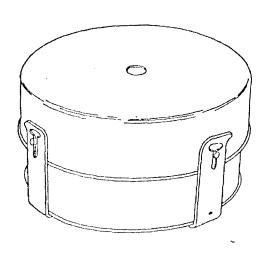

Use. The Mark 3 G.S. was used as an antivehicular mine.

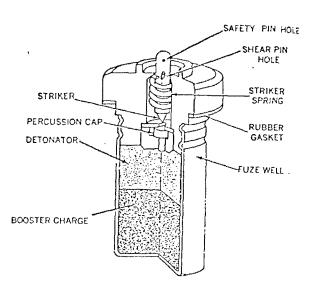

Functioning. Pressure on top of the mine cover forces it down on the striker, shearing the shear wire and releasing the striker against the percussion cap, and initiating the explosive train.

Installing and Arming.

- (1) Place the mine in the ground.
- (2) Remove the mine cover.
- (3) Insert the fuze in the fuze well.
- (4) Withdraw the safety pin from the fuze.
- (5) Replace the mine cover.

- (1) Check for and remove any antilift devices.
- (2) Remove the cover from the mine.
- (3) Pull out the fuze from the fuze well.
- (4) Remove the mine and fuze to a safe storage or disposal area.

Section of Pressure Fuze, No.3MkI

The British G.S. Mark 4 is fitted with the Mark 4 pressure cover and the pressure fuze No. 3, Mark 1. The steel mine case and the Mark 5 case are identical, except that the former locks the circular inner wall. The mine with its steel pressure cover is 20.3 centimeters in diameter and 12.7 centimeters high.

Characteristics.

Shape	Fure	Operating force	Explosive
Cylindrical	Pressure	350 to 450 lb.	8.25 lb.

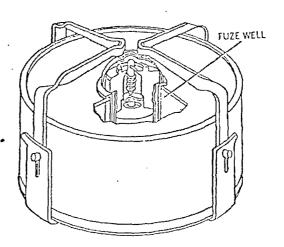

Use. The British laid this mine in large tactical minefields and in hasty road blocks against vehicles and light tanks.

Functioning. Pressure on the pressure cover crushes the protective cap over the fuze, shears the shear pin, and thus frees the springdriven striker to fire the percussion cap and explode the mine.

Installing and Arming.

- (1) Remove the pressure cover and the fuze protection cap.
- (2) Place the mine in a hole so that the top of the pressure cover, when replaced, will be less than 2.5 centimeters below the ground surface.
- (3) Inspect the fuze to see that the shear pin is in position.
- (4) Withdraw the safety pin from the fuze.
- (5) Insert the fuze into the fuze well. Do not use force; it should fit easily.
- (6) Replace the fuze protective cap and the pressure cover, making sure that the locking pins engage properly in the slots in the holding straps. Be very careful to put no pressure on the top of the fuze or the pressure cover.
- Disarming Procedure.
- (1) Check for and remove any antilift devices.
- (2) Remove the pressure cover and fuze protector cap without putting any pressure on the fuze.
- (3) Insert a safety pin or a substitute in the safety pin hole.
- (4) Remove the mine and fuze to a safe storage or disposal area.

This steel land mine may be found in two different models, the Mark 5, C.S. (general service) and the Mark 5, H.C. (higher content). The two models are identical in appearance and size (20.3 cm in dia and 10.1 cm high). The only difference is that the Model H.C. has explosive on both sides of the inner wall of the case. The fuze well, located at the top center of the case, is covered with a metal cap scated on a rubber gasket. Both models may be found fitted with either the Mark I or the Mark II pressure spider which is held in place by four slotted metal straps.

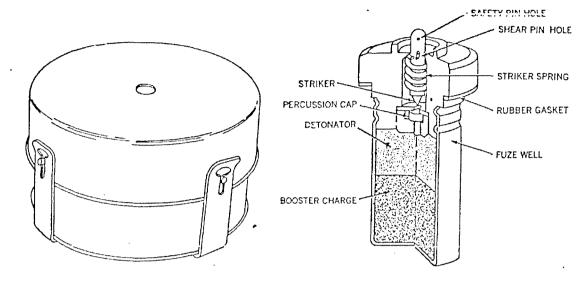

Characteristics.

			Explosive	
Shape	Fure	Operating force	Mark charge	Booster
Cylinderical	No. 3, Mark I	350 to 400 pounds pressure.	4.5 lb. TNT (GS)	TNT/CE (HC)
3			8.3 lb. TNT (IIC)	(CE is Tetryl)

Fuze bazards	Markings	Remarks
Percussion cap, detounter, and booster.	Contractors' mark and date of as- sembly are sten- cited on the side.  1.2 cm green band near the top of	1. The fuze cannot be separated from the integral percussion cap detonator and booster.
	the mine case.	
	1.2 cm red band near the bottom of the mine case.	2. Both models are obsolete, but as stocks still exist they may turn up anywhere.

Use. As antitank mines, these models are capable of stopping most medium tanks, but against heavy tanks they must be laid double.

Functioning. Pressure on the spider crushes the protective cap over the fuze and severs the shear pin, releasing the spring leaded striker against the percussion cap and firing the mine.

These steel mines are approximately 20.3 centimeters in diameter and 12.7 centimeters high. Both mines use the Mark 4 circular, steel, flat surfaced pressure cover held in place by four lugs that engage four slotted straps attached to the mine case.

### Characteristics.

Shape	Fure	Onessia	Explosive		
	, dre	Operating force	Main charge	Booster	
Circular	No. 3, Mk 1.	350 lb. pres- sure.	Mk4 GS: 8.3 lb. TNT Mk 5c: 4.5 lb. TNT or baratol.	Mk4 GS: CE/ TNT (CE is tetryl).	
Fuze h	Azard '		Remarks		
Booster asse	embly	5 excep Mark 4	t 5c is identical to that it is fit: pressure cover in spider.	ted with a	

Use. These are generally used as anti-vehicular mines.

Functioning. Pressure on the pressure cover crushes the protective cap over the fuze and severs the shear pin, releasing the spring-loaded striker against the percussion cap, firing it, and in turn the detonator, booster, and the mine.

Section of Fuze, Pressure, No. 3 Mk I.

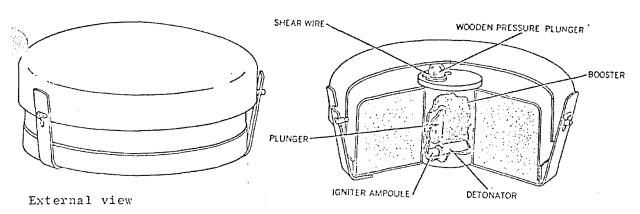

Installing and Arming.

- Remove the adhesive tap binding the pressure plate to the mine and remove the pressure plate.
- (2) Place the mine in the ground and remove the paper seal from the fuze well.
- (3) Inspect the fuze to be sure that the shear pin is in position, and then insert the fuze and remove the safety pin. If it does not come away easily discard the fuze.

Disarming Procedure.

- (1) Check for and remove any antilift devices.
- (2) Remove the pressure cover.
- (3) Insert a safety wire into the safety pin hole of the fuze.
- (4) Lift the fuze out of the mine.
- (5) Transport the mine and the fuze to a safe storage or disposal area.

Additional Precautions. Handle the fuze carefully even when the safety pin is present because of the integral percussion cap, detonator, and booster. Keep the fuzes separated from the mines at all times except during emplacement in the ground.

Section of A.T. Mine, Mk. V (E.P.) showing use of A.P. Mine No.5 as the detonator (Chemical pressure fuze, (E.P.) No. 2)

This metallic mine consists of a body, exploder mechanism, and cover. The cover is fastened down by three pins that engage in slots in three retaining straps attached to the mine body. The mine has a centered well for the special fuzes, exploders No. 1 and No. 2, which operate on the shear wire principle. In the side of the exploder body, near the base, is a channel for the inserting of the ampoule cartridge and detonator assembly. The mine is 20.3 centimeters in diameter and 6.2 centimeters high.

#### Characteristics.

Shape	Fuze	Operating force	Explosive
Mushroom.	Integral per- cussion exploder.	250 to 350 lb. pressure.	414 lb. TNT

Use. The mine will break the tracks of light or medium tanks and disable vehicles.

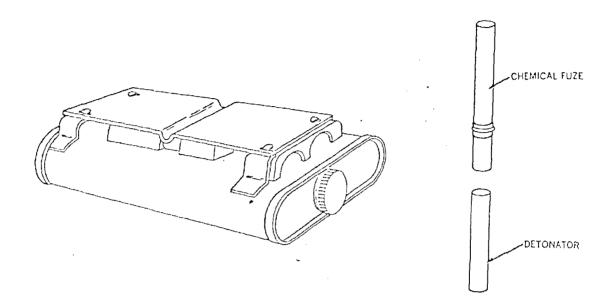

Functioning. Pressure on the top of the mine forces the plunger through the shear wire and down onto the ampoule cartridge, crushing it and firing the detonator, booster, and main charge.

Installing and Arming.

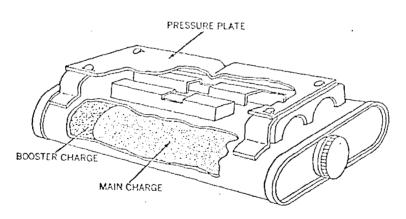

- (1) Lay the mine in the ground and remove the cover.
- (2) Place an exploder in the inverted cover and insert an ampoule, red end first, into a detonator No. 8.
- (3) Fill the open end of the detonator flush with luting.
- (4) Insert this end with luting into the hole in the side of the exploder body.
- (5) Slide the assembly home and seal in place with more luting
- place with more luting.

  (6) Grease the exploder and insert it into the fuze well.
- (7) Refit the cover.

- (1) Check for and remove any antilift devices.
- (2) Remove the pressure cover.
- (3) Remove the wooden pressure plunger from the fuze.
- (4) Carefully remove the fuze from the mine.
- (5) Pull out the detonator assembly by the tape ends projecting out of the horizontal fuze well at the bottom of the fuze case.
- (6) Transport the mine and fuze to a safe storage or disposal area.

External view of Mine and fuzes

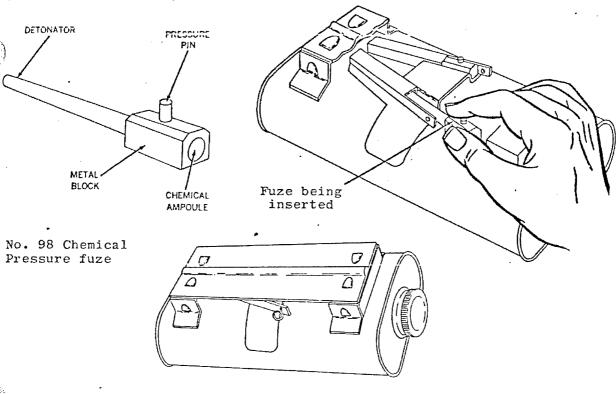

Hawkins Grenade, No. 75, Mk. I. (in section)

The Hawkin's grenade mine No. 75, Mark I, is an earlier model of the Hawkin's grenade mine No. 75, Mark II. The fuze wells are located parallel to each other, instead of in a V-shape as in the Mark II. The fuze is similar to the chemical pressure fuze No. 98, but lacks

the metal block with the pressure pin. The pressure plate has a transverse groove instead of a longitudinal ridge. In all other characteristics, this mine is similar to the Hawkin's grenade mine No. 75, Mark II. Disarming is merely removing the fuzes.

Hawkins Grenade Mine, No. 75, Mk. II.

External view

Hawkin's grenade mine No. 75, Mark II consists of a steel case containing a main charge and a booster charge. A filler cap is located in the end of the case. The top of the case is fitted with two fuze wells which lie flat in a V-shape. These fuze wells are covered with a pressure plate with a longitudinal ridge. The chemical pressure fuze No. 98 is employed with this mine. The mine is 17.7 centimeters long, 10.1 centimeters wide, and 6.2 centimeters high.

Characteristics.

Shape	Fuze	Operating force	Explosive	
Tubular flattened.	Two No. 98 chemical pressure.	80 to 100 lb.	1.5 lb.	

Use. This dual-purpose mine is employed in security and protective type minefields. It is also installed in tactical minefields (in pairs and groups of four) and in roadblocks. One mine will seriously injure a man stepping on it. Mines laid in pairs will disable trucks and break the tracks of light tanks. Four mines laid together may break the track of a medium tank.

Functioning. Pressure on the pressure plate causes it to bend, forcing the pressure pin of one fuze, or both, against the ampoule of chemical and crushing it. A chemical reaction takes place producing a flame which sets off the detonator, firing the mine.

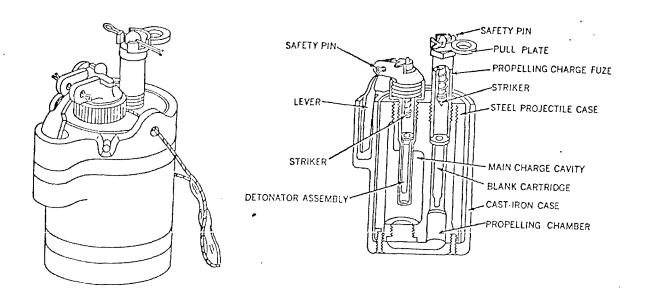

Installing and Arming.

- (1) Insert the ampoules and detonators in the fuzes.
- (2) Insert the fuzes in the fuze wells under the pressure plate, pushing in the detonator end first.
- (3) Insert the fuze pin through the holes in the ends of the fuze wells.
- (4) Place the mine in the ground with the filler cap pointing in the direction of the opposing forces. When installing the mines in pairs, place one mine on top of the other. Make sure that the pressure plate of the upper mine is flush with the surface of the ground.

- (1) Check for and remove any antilift devices.
- (2) Withdraw the fuze pin and pull out the fuzes.
- (3) Remove the mine and fuzes to a safe storage or disposal area.

# **B) BRITISH ANTI-PERSONNEL MINES**

Antipersonnel Schrapnel Mine, Mk I. German nomenclature: S.Mi.441(e)

External view

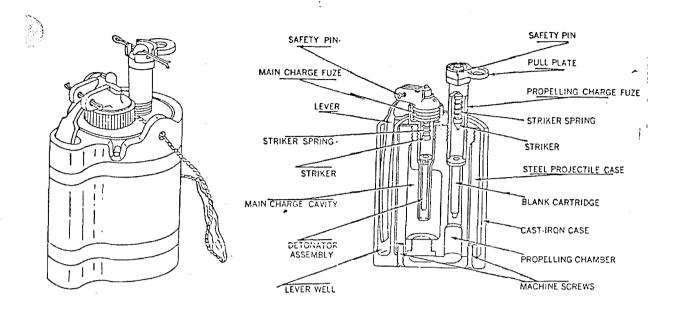

Schrapnel Mine, Mk I. (in section)

The British antipersonnel shrapnel mine, Mark I, is an earlier model of the shrapnel mine, Mark II It is identical to the Mark II except for the following differences: the lever on the detonating fuze in the Mark I is short and does not extend the full depth of the mine case; the percussion-cap-and-detonator assembly in the Mark I has a delay pellet; the mine case of the Mark I has "71A" stenciled on it in black, and the Mark I has a leather carrying strap instead of a wire handle.

### Characteristics.

Shape	Case	Operating force	Fuze		
			Main charge	Propellant	Explosive
Cylindrical with a bulge on one side for the lever case.	Cast iron.	4 lb. pull.	Mechan- ical lever- release.	Pull, requiring 4 lb. force for release.	1 lb. ama- tol.
		M	arkings	I	***************************************

Two red stripes are painted around the case.

#### Exterior view

This is a bounding fragmentation mine consisting of a cast iron case 13.9 centimeters high and 8.8 centimeters in diameter, containing a steel-cased cylindrical projectile fastened to the bottom of the case by two machine screws. The mine has two mechanical fuzes, one for firing the propelling charge and one for the main charge. Although the effective casualty radius is 9 to 14 meters, it is dangerous to personnel at distances up to 46 meters.

Use. This mine is laid in antipersonnel minefields for security and in antitank minefields to hinder reconnaissance and breaching parties.

Functioning. Force applied to the tripwire of the propelling fuze pull-plate pulls out the plate releasing the spring-driven striker against the blank cartridge. The pressure from the blank cartridge explosion breaks the screws holding the projectile to the case and propels it into the air. The lever retaining the striker of the main charge fuze clears the well on the side of the case and springs outward, which eleases the spring-actuated striker against the setonator assembly and fires the main charge at about 1 meter above the ground.

# Bounding A.P. Mine Mk II (in section)

Installing and Arming.

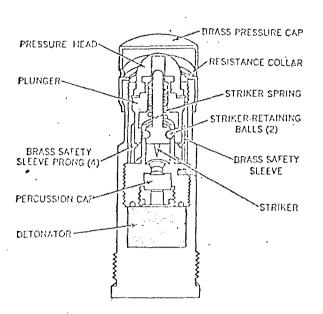

- (1) Unscrew the propelling charge fuze with a wrench.
- (2) Insert the blank cartridge in the fuze well and replace the fuze.
- (3) Unscrew the main charge fuze.
- (4) Insert the detonator assembly with with the percussion cap uppermost and replace the fuze with its striker retaining lever extended downward into its well.
- (5) Place the mine in the hole so that the pull plate of the propelling charge fuze is just above ground level.
- (6) Attach the tripwire to an anchor and to the pull plate.
- (7) Remove the safety pins from both

- (1) Check for and remove any antilift devices.
- (2) Insert a safety pin or rail in the safety-pin hole of each fuze.
- (3) Trace and cut the tripwire.
- (4) Unscrew the propelling charge fuze and remove the blank cartridge.
- (5) Unscrew the main charge fuze and remove the detonator assembly.
- (6) Transport mine and fuzes to a safe storage or disposal area.

# C) BRITISH MINE FUZES

Pressure fuze, No.1, Mk I.

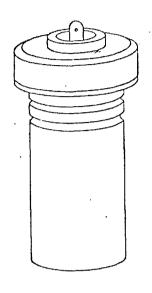

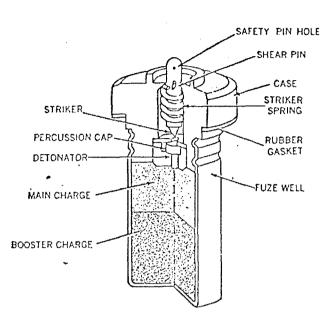

a. Description. The British pressure fuze, antitank, No. 1, Mark I is of the instantaneous, mechanical type and contains a spring-loaded striker with a ball release. It consists of a cylindrical brass case housing a pressure head, a plunger, a brass safety sleeve with four prongs that retain the plunger and the pressure head, a spring-loaded striker held in place by two striker-retaining balls, and a brass resistance collar surrounding the pressure head. A percussion cap and a detonator are built into the base of the fuze. A brass pressure cap covers the pressure head.

b. Employment.' This fuze was designed specifically for use with the G. S. (general service) antitank mine, Mark II

#### c. Functioning.

- (1) A pressure of 350 pounds crushes the brass pressure cap.
- (2) The pressure head and the plunger are forced down, pushing aside the four prongs on the brass safety sleeve and compressing the striker spring.
- (3) The striker-retaining balls are forced outward into a recess in the plunger, releasing the spring-loaded striker against the percussion cap.
- d. Installing and Arming. This fuze has no safety devices. Screw the fuze into fuze well of the G. S. antitank mine, Mark II.
- e, Neutralizing. Although this fuze has no safety devices, the high pressure required to actuate it makes it fairly safe to handle. Unserew the fuze from the mine.

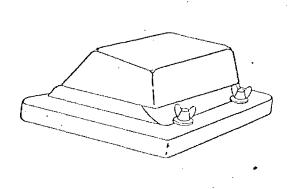

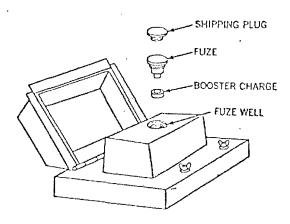

- a. Description. The British pressure fuze, antitank, No. 3, Mark I is of the instantaneous, mechanical type and contains a springloaded striker with a shear-pin release. The striker is held in place by a shear pin that is inserted through the striker shaft so as to bear against the top of the case. A cotter-pin type safety pin is inserted through the striker shaft just above the shear pin. The top of the cylindrical steel case is larger in diameter than the base. Crimped onto the base of the fuze is a cup that holds a detonator and a booster charge.
- b. Employment. This fuze is used in the G. S. antitank mine, Mark V the G. S. antitank mine, Mark V HC the G. S. antitank mine, Mark Ve and the G. S. antitank mine, Mark IV
- c. Functioning. A pressure of from 400 to 500 pounds on the end of the striker shaft shears the shear pin, releasing the spring-loaded striker against the percussion cap and firing the detonator and the booster charge.
- d. Installing and Arming. Place the fuze in the mine and withdraw the safety pin.
- e. Neutralizing. Insert a safety pin or a nail in the safety-pin hole. Because of the high pressure necessary to shear the shear pin, the fuze would be safe to handle if it were not for the built-in detonator and booster charge. Because of the detonator and the booster charge, extreme care should be taken while handling the fuze, even when the safety pin is in place.

# Appendix G, Annex 4 French Mines and Fuzes

## A) FRENCH ANTI-TANKS MINES

M-1935 Heavy AT-mine

a. Description. The French heavy antitank mine, M-1935 has a rectangular steel charge container welded to a steel base. The mine is 161% inches long, 10 inches wide, and 43% inches high. It weighs 27 pounds including 3.25 pounds of explosive. A hinged, steel pressure cover fits over the charge container and is held in place by two wing nuts. In the top of the charge container is a single fuze well. The fuze used in this mine is the pressure fuze, antitank, M-1935 and 1936

A doughnut-shaped metal-cased booster charge is provided and is placed in the fuze well when the mine is armed. A threaded shipping plug closes the fuze well. A metal safety collar

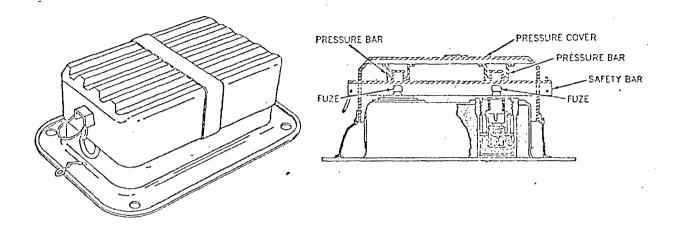

- b. Employment. This mine was designed for employment in permanent defensive installations.
- c. Functioning. A pressure of about 800 pounds on the pressure cover crushes the cover until it bears against the striker shaft of the fuze, shearing the shear pin. Shearing the pin releases the spring-loaded striker against the percussion cap, firing the mine.

## d. Installing and Arming.

- (1) Place the mine in a hole deep enough for the top of the mine to be flush with the ground surface or a little below it. When laying mine fields or belts, keep 6-foot intervals, at least, between mines.
- (2) Lift up the pressure cover and unscrew the shipping plug from the fuze well, or remove the safety collar from around the fuze if the mine is shipped with the fuze in place.
- (3) Insert the booster charge in the fuze well and screw in a pressure fuze, antitank, M-1935 and 1936, with percussion-capand-detonator assembly.
- (4) Lower the pressure cover and fasten it with the wing nuts.

## c. Neutralizing.

- (1) Check for and neutralize activating fuzes.
- (2) The pressure cover may have an activating fuze attached. After unfastening the wing nuts, pull the cover up with a rope or wire. Stay a distance of 50 yards from the mine.
- (3) Unserew the fuze.
- (4) Unscrew the percussion-cap-and-detonator assembly from the bottom of the fuze.
- (5) Lift out the booster charge.

a. Description. The French light antitank mine, M-1936 has a rectangular steel charge container, 9½ inches long, 5½ inches wide, and 4½ inches high. The mine weighs 14.5 pounds, including 5.75 pounds of explosive. It uses the pressure fuze, antitank, M-1935 and 1936

Two fuze wells are located in the top of the charge container. The flanged base plate has a hole in each corner for hold-down bolts when the mine is laid in permanent defensive positions. A corrugated pressure cover fits over the charge container and is strongthened by a metal strip. Two metal pressure bars are welded to the underside of the pressure cover and are positioned above the fuzes when the cover is in place. A channel-shaped aluminum safety bar passes longitudinally through the pressure cover and rests over the fuzes, preventing them from being actuated. Wires or chains attached to both ends of the base plate fit over hooks on the pressure cover to hold the cover in place. One of the wires or chains is permanently attached to the pressure cover and the base plate.

- b. Employment. This mine was designed for employment in antitank mine fields and in permanent defensive positions.
- c. Functioning. A pressure of from 300 to 500 pounds on the pressure cover causes downward movement of the attached pressure bars against the striker shaft of one or both of the fuzes shearing the shear pin. Shearing the pin releases the spring-loaded striker against the percussion cap, firing the mine.

## d. Installing and Arming.

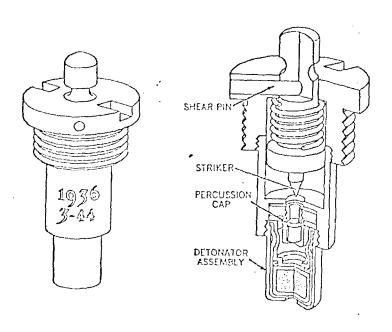

- (1) Place the mine in a hole deep enough for the top of the mine to be flush with the ground surface or a little below it. When laying a mine field or belt, keep 6-foot intervals, at least, between mines.
- (2) Remove the pressure cover and screw two pressure fuzes, antitank, M-1935 and 1936, with percussion-cap-and-detonator assemblies, into the fuze wells.
- (3) Insert the safety bar through the holes in the ends of the pressure cover,
- (4) Replace the pressure cover and put the wire or chain over the hook to hold it in place.
- (5) Withdraw the safety bar.

# e. Neutralizing.

- (1) Check for and neutralize any activating fuzes. The pressure cover may have auactivating fuze attached. Examine the pressure cover carefully and then take the wire or chain off the hook.
- (2) Lift the pressure cover. If there is any evidence of activation, pull the pressure cover off with a rope or wire. Stay a distance of 50 yards from the mine.
- (3) Unscrew and remove both fuzes.
- (4) Unserew the percussion-cap and detonator assemblies from the bottoms of the fuzes.

# **B) FRENCH MINE FUZES**

Pressure fuzes, M-1935 and M-1936

with a brass percussion-cap holder and detonator assembly, while the M-1936 fuze is made of aluminum with an aluminum percussion-cap holder and detonator assembly.

- b. Employment. This faze is used in both the light and the heavy French antitank mines
- c. Functioning. A pressure of 400 pounds, or more, on the striker shaft shears the shear pin and releases the spring-loaded striker against the percussion cap, firing the detonator.

# APPENDIX H TERRAIN ANALYSIS

#### TERRAIN OVERVIEW

Generalfeldmarshall Rommel remarked that at El Alamein, "Rivers of blood were poured out over miserable strips of land which, in normal times, not even the poorest Arab would have bothered his head about." The Sahara Desert is mainly characterized by vast, hot, dry, and barren plains with large diurnal ranges in temperature with a few widely spaced settlements. The terrain has many large flat plain surfaces, thousands of square miles of sand dunes; several fairly large areas of rugged, rocky hills and mountains; numerous steep-sided escarpments, wadis, and depressions with salt marshes. Ever since the British occupation of Egypt, the El Alamein Line had been recognized as the best position on which to defend the cultivated area along the Nile River and the Suez Canal against attack from the west. The line was sited between the Mediterranean Sea coast northeast of El Alamein and the northern edge of the Qattara Depression at Naqb Abu Dweis. It straddled the narrowest part of the coast belt on a front of about 60 kilometers and rested its flanks on the Sea and the impassable depression. The few natural obstacles and marked features on the line had an importance, which explains much of the course of the fighting. Afternoon temperatures in the summer (June through September) usually ranged from 90° to 120° F (32 to 49° C) or more. The nights are cool while winters are mild.

#### **OBSERVATION**

Generally, observation was excellent in the desert. The dust clouds raised by moving vehicles were particularly obvious and favored the defender.

# **RIDGES**

Low-lying ridges in the area provided a degree of improved observation. Miteiriya Ridge (5 to 6 meters above the surrounding desert) was southwest of El Alamein while the Ruweisat Ridge (10 to 20 meters above the surrounding desert) ran eastward from near Deir el Shein. Towards the Qattara Depression, the ground along the escarpment is broken into small flat-topped hills such as Qaret el Himeimat (215 meters), the El Taqa Plateau (218m), and Qaret el Khadim (174 meters). Qaret el Himeimat towered 100 meters over the surrounding desert. On a clear day, one could see the Mediterranean Sea, 49 kilometers to the north.

#### **DESERT HAZE**

The high daytime temperatures in the desert cause an atmospheric haze that adversely affects visibility. When this haze condition is at its height, usually in mid-afternoon, a crawling man is obscured or his figure completely distorted at 200 meters. This haze phenomenon was often used as a cover for reconnaissance.

#### WIND

The winds of the Sahara Desert affected operations in several ways. Fast moving winds heavily laden with sand and dust often reduced visibility. In other situations, sand and dust storms (variously called Shamals, Khamsins, or Ghiblis) restricted visibility to only tens of meters.

# **COVER AND CONCEALMENT**

#### **DEPRESSIONS**

Of the sparse terrain features in the area, some of the most notable were the depressions such as Deir el Shein, Deir el Mreir and Deir el Munassib. These shallow depressions, typically about 10 to 20 meters below the surrounding desert, were located near the middle of the front and provided some cover to their occupants.

# FIELD FORTIFICATIONS

The open desert was generally devoid of any cover or concealment. Therefore, soldiers were forced to make their own. Throughout the length of the line, the ground was generally rocky, requiring power tools and explosives for entrenchment. In the few areas of sand or sandy soil, field fortification was relatively easy to

<sup>&</sup>lt;sup>1</sup> The Rommel Papers, by Erwin Rommel (edited by B. H. Liddell Hart), Harcourt Brace and Company, New York, 1953, page 306.

establish. Such conditions, however, did not exist over wide stretches of the desert plateaus. In many areas, the ground is flat and stony with barely a covering of dust to hide the rocky sub-mantel. In some places, even the dust cover is missing and nothing but solid rock exists.

## **OBSTACLES**

Inland from the seacoast, there is a strip of salt marsh and then a belt of sand and dunes about 200 meters wide. The land then rises about 20 meters in a ridge along which the coast road runs. South of the road is the Egyptian Republic Railway, which runs along an elevated embankment for portions of its length in the battle area. This embankment formed a significant obstacle to north-south movement in places. From the road and railway, the ground gradually rises over a wide and rather featureless plain to the escarpment, which has an elevation of about 210 meters above sea level. From the escarpment, the ground drops precipitously some 230 meters into the impassable Qattara Depression (10 to 20 meters below sea level). This relatively narrow strip, between the Mediterranean Sea and the Qattara Depression, canalized all land traffic. This line could be penetrated, but not turned.

## **QATTARA DEPRESSION**

This terrain feature is the reason the panzerarmee and the 8<sup>th</sup> Army fought at El Alamein. The salt marshes and sand dunes of the Qattara Depression make it impassable to vehicle columns of any size. Consequently, it was the only position in Egypt and Libya that could not be outflanked to the south. Nevertheless, small raiding parties in light vehicles could and did traverse the area on fragile caravan routes over the soft ground.

#### WADIS

A wadi is normally a dry, steep sided ravine. These frequently constituted a natural obstacle in its own right. Many of the Saharan wadis were sufficiently wide and deep to significantly effect military operations. Wadis were nearly always mined, particularly at likely crossing places. In several instances, they were used as a structural part of defensive positions with minefields in front, within and sometimes behind their course. When it rained, the wadi could become a rivulet or a torrent. Their mined bottoms were affected accordingly.

## RAINFALL

The Sahara Desert has no season of regular rains. The rain that it does receive it owes to the passage of storms, the dates of which are entirely erratic and the effects more or less confined to single localities. The Saharan rainfall is characterized primarily by its irregularity. It might rain for only short periods but it could be a heavy deluge.

## **ESCARPMENTS**

The various escarpments, located south of the coastal plains of the Sahara Desert, rise sometimes abruptly, sometimes in several tiers, but always steeply and up to heights of about 200 meters above sea level. They effectively block traffic wishing to move from the coast to the desert plateau above. Access can be gained only along a few roads or tracks that climb steeply through certain passes. The escarpment itself is almost impassable to wheeled or tracked vehicles for about 200 kilometers west of Naqb Abu Dweis. These passes up the escarpments consistently received the attention of opposing sappers and miners. The passes in Egypt, situated nearest the frontier, were mined very early in the conflict. The Italians, for example, hit their first British mines at Halfaya Pass at the start of their 1940 invasion of Egypt.

## **MILITARY (REINFORCING) OBSTACLES**

The vast openness of the North African plateau environment, in conjunction with a very early recognition of the effectiveness of mines, encouraged the use of mines on a massive scale. Mass mining was first employed by the British 8<sup>th</sup> Army in the construction of its line at Gazala in March, April and May of 1942. The 8<sup>th</sup> Army applied the same mine tactics at El Alamein in July and August of the same year. An estimated half million or more mines were emplaced in each of these lines. *Generalfeldmarshall* Rommel, obviously impressed by the British "Mine Marsh" tactics at Gazala and El Alamein, employed the same concept, with added dimensions, in his own defense of the El Alamein position against the 8<sup>th</sup> Army. The panzerarmee's defenses contained no fewer than 481,000 mine devices by the time they were attacked on 23 October 1942. Mine-laying was relatively easy and routine in sand or sandy soils with depths of 30 centimeters or more. Such sand and soil depths, however, do not exist over wide stretches of the desert plateaus. In many areas, the ground is flat and stony with barely a covering of dust to hide the

rocky sub-mantel. In some places, even the dust cover is missing and nothing but solid rock exists. Conditions can vary even in areas with shallow soil depths. Mine-laying was a very difficult task under such circumstances.

## **KEY TERRAIN**

The vast and barren desert plains of the El Alamein region have relatively little key terrain. Aside from the Qattara Depression in the south, Qaret Himeimat and Miteiriya Ridge were the most significant terrain features of the battlefield. These low-lying ridges provided a degree of observation. As stated earlier, Miteiriya Ridge (5 to 6 meters above the surrounding desert) was southwest of Alamein while the Ruweisat Ridge (10 to 20 meters above the surrounding desert) ran eastward from near Deir el Shein. Towards the Qattara Depression, the ground along the escarpment is broken into small flat-topped hills such as Qaret Himeimat (215 meters), the El Taqa Plateau (218m), and Qaret el Khadim (174 meters). After the Battle of Alam Halfa in September, General Montgomery directed that the panzerarmee be allowed to retain control of Qaret Himeimat. This hill towered 100 meters over the surrounding desert. As part of his deception plan, General Montgomery wanted the panzerarmee to see the activities of XIII Corps in order to convince them that this was the main effort. Once the battle was underway, it was imperative for XIII Corps to force the Axis off of Qaret Himeimat. If they remained on the hill, they would be able to observe and interfere with the British breaches of the minefields to the east and to direct artillery fire on to them.

Although the low-lying Miteiriya Ridge was only 5 to 6 meters above the surrounding desert, it was nevertheless, key terrain to the Axis forces because it provided a reverse slope defense against the Commonwealth armored units. However, while the position provided some initial protection against Allied direct fire, defending from the reverse slope also prevented the Axis units from covering their forward obstacles with effective direct fire. Later, during the battle, the ridge provided the defenders a critical advantage over the British armor, which was attempting to exploit the initial success of the 2<sup>nd</sup> New Zealand Division.

## **AVENUES OF APPROACH**

The approaches to the position follow three main lines -1) the coast road and railway, 2) the Barrel Track from Fuka through the Deir el Munassib and 3) the Qaret el Himeimat to Cairo Road then along a narrow, trafficable strip running north of the escarpment. Patches of camel thorn scrub, soft sand, and rocky outcroppings complicate movements by wheeled transport.

#### **COASTAL PLAINS**

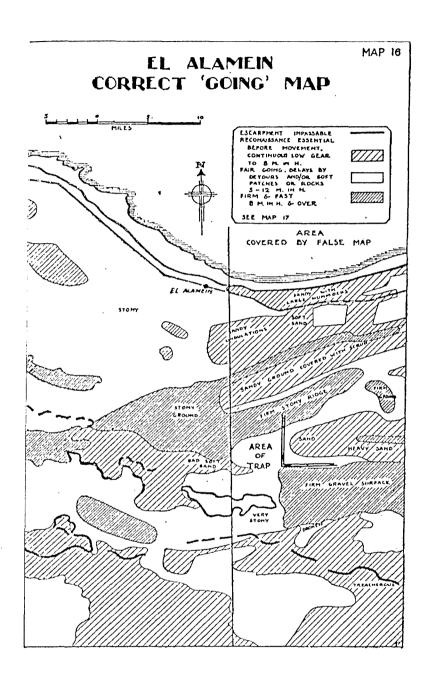

The coastal plains carried the main lines of communications, including the all important 3000-kilometer long main east/west coast road running from Alexandria in Egypt to Tunis. This road ran near the coast, occasionally swerving inland, to touch the bigger towns. At several points, these inland swerves crossed rather formidable escarpments. Among the towns and other localities situated along this main road, and of military importance, were El Alamein, El Daba, Fuka, Matruh, Sidi Barrani, Sollum, Bardia, Tobruk, Gazala, Benghazi, Agedabia, El Agheila, Tripoli, and Medenine. The harbor facilities at Tobruk, Benghazi and Tripoli increased the military importance of the coastal plains. The only railroad located within the fighting zone of the region also ran along the coastal plain proceeding westward from Alexandria. From time to time this line was extended to serve the operational needs of the British forces and eventually reached Tobruk.

The coastal road and its adjacent verges were constantly mined because of its military importance in pursuit or retreat. Off-route mining was usually tied to the salt marsh obstacles that were also mined on a number of occasions. The road and off-road mining and countermining incidences related in Chapter 7, are representative of some of the most intense mining and countermining operations that were carried out in the coastal plains area. Off the main road in the coastal plain, motorized going ran the gamut from good to bad. Patches of deep sand and salt marshes were the principle obstacles.

#### **DESERT PLATEAUS**

The desert plateaus lying south of the escarpments provided space enough for sweeping maneuver. Natural terrain obstacles constraining such movements were few, particularly obstacles blocking movement eastward and westward. As *Generalfeldmarshall* Rommel observed in his survey of the North African battlegrounds, that there was only one position in Egypt or Libya, the one at El Alamein, which could not be turned at its southern flank. The

first real obstacle to east and west movement, the Qattara Depression, was some 60 kilometers inland from El Alamein.

## APPENDIX I. AXIS ORDER OF BATTLE<sup>1</sup>

(As of 23 OCT 1942, unless otherwise noted)

Panzerarmee Afrika: commanded by General Der Kavallerie Georg Stumme (until KIA 24 OCT) then Generalfeldmarshall Erwin Rommel, senior Pioneer: Oberst Hans Hecker replaced Oberst Gerhard Jordan, 29 Oct 41, later (8 Nov 42) replaced by Generalmajor Karl Buclowius. For many units of the panzerarmee, the most current equipment strength report predates the Battle of Alam Halfa. During this battle, the Germans lost 1,859 men and 38 tanks, while the Italians lost 1,051 men, 50 guns (47mm or larger) and about 400 trucks. The Germans had 12,600 vehicles (including the Luftwaffe), while the Italians had 3,500 vehicles.

<sup>&</sup>lt;sup>9</sup> "The Campaign in North Africa 1941/3, Volume 2, The Campaign in the Year 1942," by General der Panzertruppe Walther Nehring, MS # T-3, Foreign Military Studies, Headquarters, US Army Europe, 1948, Anlage (Appendix) 18, pages 9 and 10.

<sup>10</sup> See the order of battle for the Ariete Armored Division in this appendix (page I-15) for a more detailed breakout of this unit at the beginning of the Second Battle of El Alamein.

90th Leicht Afrika Division: commanded by Generalmajor Theodor von Sponeck from 22 SEP replaced Generalmajor Kleeman, WIA 1 SEP (in the interim, Generalmajor Rameke, and Oberst Schulte-Heuthaus commanded the division), combat strength of 99/352/1989 out of a ration strength of 181/60/843/3955 as of 20 OCT 42 (not including SV 288) of approximately 8,000 authorized. 11

Division HQs (authorized 34 medium motorcycles, 7 Kfz 1, 9 Kfz 15, 1 Kfz 21, 5 light trucks, 11 medium trucks, 3 medium columns, 1 Sd Kfz 261)

Signals Company (Motorized) (authorized 8 motorcycles, 1 Kfz 2, 1 Kfz 2/40, 1 Kfz 12, 9 Kfz 15, 18 Kfz 17, 2 Lt. Pkw. (o), 20 medium trucks)

Mapping Detachment (Motorized) (authorized 1 Kfz 1, 1 Lt. Command Car)

155th Motorized Grenadier Regiment commanded by Oberstleutnant Kolbeck (OCT 42, replaced Oberst Marks), combat strength of 22/96/51/1145 of 20 OCT 42.

Regimental HHC (authorized 15 medium motorcycles, 3 heavy motorcycles, 26 heavy motorcycles with sidecar, 4 Kfz 2, 1 Kfz 2/40, 13 Kfz 15, 4 Lt. Pkw. (o), 10 Lt. Trucks, 10 medium trucks, 1 medium command car)

Motorcycle Platoon

Motorized Engineer Platoon

Motorized Signal Platoon

1st Battalion (Oberstleutnant Kaiser)

Battalion Staff (authorized 8 medium motorcycles, 4 medium motorcycles with sidecars, 5 Kfz 1, 2 Kfz 2, 5 Kfz 15, 1 Kfz 31, 5 lt trucks 4 medium trucks)

three rifle companies (each authorized 12 LMGs, 3 PzBu39, 3 28mm PzBu41, 1 50mm mortar, 6 76.2mm Russian PAK guns, 1 Kfz 1, 3 lt. Trucks, 8 medium trucks)

one heavy company (authorized 6 HMGs, 6 80mm mortars, 2 37mm PAK 36, 2 50mm PAK 38, 1 Kfz 15, 3 Kfz 1, 3 lt trucks, 8 medium trucks)

2<sup>nd</sup> Battalion (Major Kost)

Battalion Staff (authorized 8 medium motorcycles, 4 medium motorcycles with sidecars, 5 Kfz 1, 2 Kfz 2, 5 Kfz 15, 1 Kfz 31, 5 lt trucks 4 medium trucks)

three rifle companies (each authorized 12 LMGs, 3 PzBu39, 3 28mm PzBu41, 1 50mm mortar, 6 76.2mm Russian PAK guns, 1 Kfz 1, 3 lt. Trucks, 8 medium trucks)

one heavy company (authorized 6 HMGs, 6 80mm mortars, 2 37mm PAK 36, 2 50mm PAK 38, 1 Kfz 15, 3 Kfz 1, 3 lt trucks, 8 medium trucks)

13th Motorized Infantry Gun Company (2 150mm guns, 4 75mm L18 guns, 3 LMGs, 3 Kfz 1, 1 Kfz 15, 8 lt. Trucks, 4 medium trucks, 2 Sd Kfz 2)

14th Pioneer Company (6 75mm or 76.2mm AT guns) (on-hand?)

200th Motorized Grenadier Regiment commanded by Oberst Koester (OCT 42, replaced Oberst Geissler), combat strength of 19/78/401 of 20 OCT 42.

Regimental HHC

Motorcycle Platoon

Motorized Engineer Platoon

Motorized Signal Platoon

1st Battalion

three rifle companies (each authorized 12 LMGs, 3 PzBu39, 3 28mm PzBu41, 3 50mm mortar, 6 76.2mm Russian PAK guns, 1 Kfz 15, 3 Kfz 1, 3 lt. Trucks, 8 medium trucks)

one heavy company (authorized 6 HMGs, 6 80mm mortars, 2 37mm PAK 36, 2 50mm PAK 38, 1 Kfz 15, 3 Kfz 1, 3 lt trucks, 8 medium trucks)

2<sup>nd</sup> Battalion

three rifle companies (each authorized 12 LMGs, 3 PzBu39, 3 28mm PzBu41, 3 50mm mortar, 6 76.2mm Russian PAK guns, 1 Kfz 15, 3 Kfz 1, 3 lt. Trucks, 8 medium trucks)

one heavy company (authorized 6 HMGs, 6 80mm mortars, 2 37mm PAK 36, 2 50mm PAK 38, 1 Kfz 15, 3 Kfz 1, 3 lt trucks, 8 medium trucks)

13th Motorized Infantry Gun Company (2 150mm guns, 4 75mm L18 guns, 3 LMGs, 3 Kfz 1, 1 Kfz 15, 8 lt. Trucks, 4 medium trucks, 2 Sd Kfz 2)

14th Pioneer Company (6 75mm or 76.2mm AT guns) (on-hand?)

361st Motorized Grenadier Regiment commanded by Oberstleutnant Panzenhagen (1 JUL 42, replaced Oberst Menny), combat strength of 24/79/309 as of 20 OCT 42, composed of repatriated Germans who had served in the French Foreign Legion before the war.

Regimental HHC (authorized 27 Kfz 1, 3 Kfz 2, 11 Kfz 12, 5 Kfz 17 radio trucks, 1 Kfz 23, 1 Lt. Truck, 20 medium trucks, 1 medium command car, 35/919 assigned as of 22 Aug)

Motorcycle Platoon

Motorized Engineer Platoon

Motorized Signal Platoon

1st Battalion (Major Ryll, replaced Oberstleutnant Panzenhagen)

three rifle companies (each authorized 12 LMGs, 3 PzBu39, 3 28mm PzBu41, 3 50mm mortar, 4 French 75mm guns, (or 4 37mm PAK 36), 2 37mm PAK 36, 1 Kfz 15, 3 Kfz 1, 3 lt. Trucks, 8 medium trucks)

<sup>&</sup>lt;sup>11</sup> <u>Die 5. (lei.)/21. Panzer Division in Nordafrika, 1941-1943</u>, by Heinz-Dietrich Aberger, Preussischer Militar-Verlag, Reutlingen, 1994, page 279, states that 90<sup>th</sup> Leicht Afrika Division had an actual strength (tatsachliche starke) of 2,827 men, based on KTB Nr. 26, Pz.AOK/Ia (RH-19 VIII/20) on the morning of 23 October 1942. See also <u>Kriegstagebuch Nr.3, 90<sup>th</sup> Leicht Afrika Division</u>, US National Archives, Captured German Records Division, Series T-315, Rolls 1155-1159, starting on frame 405.

one heavy company (authorized 6 HMGs, 6 80mm mortars, 2 37mm PAK 36, 2 50mm PAK 38, 1 Kfz 15, 3 Kfz 1, 3 lt trucks, 8 medium trucks)

2<sup>nd</sup> Battalion (Hauptmann Rotschuh, SEP 42)

three rifle companies (each authorized 12 LMGs, 3 PzBu39, 3 28mm PzBu41, 3 50mm mortar, 4 French 75mm guns, (or 4 37mm PAK 36), 2 37mm PAK 36, 1 Kfz 15, 3 Kfz 1, 3 lt. Trucks, 8 medium trucks) one heavy company (authorized 6 HMGs, 6 80mm mortars, 2 37mm PAK 36, 2 50mm PAK 38, 1 Kfz 15, 3 Kfz 1, 3 lt trucks, 8 medium trucks)

13th Motorized Infantry Gun Company (2 150mm guns, 4 75mm L18 guns, 3 LMGs, 3 Kfz 1, 1 Kfz 15, 8 lt. Trucks, 4 medium trucks, 2 Sd Kfz 2)

14th Pioneer Company (6 75mm or 76.2mm AT guns) (on-hand?)

190th Panzer Battalion (three companies of light tanks and one of mediums, not in Africa)

190th Artillery Regiment (combat strength of 328 men as of 20 Oct 42, not officially on hand until NOV 42)

Regimental Staff Battery

1st Battalion (Hauptmann Kreupa (JUL 42, replaced Hauptmann von Schrimpff, captured JUL 42) combat strength 16/39/273 as of 20 OCT 42 (including 190<sup>th</sup> Motorized FLAK Company), authorized 2 motorized 105mm leFH 18 batteries & one motorized 100mm K17 gun battery, each with 2 LMGs)

190<sup>th</sup> Motorized FLAK Company (authorized 12 20mm FLAK guns)

2<sup>nd</sup> Battalion (authorized 2 motorized 105mm leFH 18 batteries & one motorized 100mm K17 gun battery, each with 2 LMGs, apparently not on hand at this time)

580th Reconnaissance Battalion (Major Voss, detached from the division, combat strength 387 men as of 20 Oct 42)

one armored car platoon (on-hand 2 Armored Cars, 4 MTW, 2 self-propelled gun carriages, as of 15 August) one motorized reconnaissance company (on-hand 18 LMGs, 2 HMGs, 3 PzBu 39, 4 50mm PAK 38s, as of 15 August) one heavy reconnaissance company (on-hand 21 LMGs, 2 HMGs, 1 80mm mortar, 8 50mm PAK 38, as of 15 August)

one panzerjager platoon (3 self-propelled 75mm or 76.2mm AT guns, as of 15 August) one pioneer platoon

signals platoon

one motorized artillery battery (7 British 25-pdrs, as of 15 August)

190th Panzerjäger Battalion (combat strength of 7/21/144 as of 20 OCT 42, authorized 2 motorized AT companies each with 7 50mm PAK 38s)

900<sup>th</sup> Motorized Pioneer Battalion (Major Kuba, combat strength 8/21/211 of 17/545 authorized as of 20 OCT 42, authorized 12.5 cm PAK (4 on-hand) and 28 machine guns (9 on-hand), also, 4 s. PzBu41 and 7 20cm *leichter Ladungswerfer* (spigot mortars, literally "light charge throwers") on-hand. On average, each pioneer battalion in the Afrika Korps was authorized 170 vehicles (53 motorcycles, 25 PKW, 92 LKW, and 18 panzers (33<sup>rd</sup> and 200<sup>th</sup> pioneer battalions only), close combat material (28 flamethrowers, demolition sets 28 (a), 10 (b), 40 (c), 25 (d), *Sprengmittel satz* a,b,c,d, Detonator sets (*zündmittel kasten satz*) 12 (a), 20 (b), 6 (c) and 3 *zündmittel für "S" minen*,) power tools (21 power saws, 8 compressors, 8 well drilling equipment sets, 2 welding sets (33<sup>rd</sup> and 200<sup>th</sup> pioneer battalions only), bridging equipment (7 large rubber rafts, 9 small rubber rafts, various rope), and entrenching tools (270 spades, 122 axes, 133 hatchets, 65 wire cutters, 73 mattocks, 42 e-tools, 34 augers(?), 43 tape measures. The nominal basic load of ammunition was 351 kilograms of explosive (in 100, 200, 1000, and 3000 gram blocks), 2600 meters of detonating cord, 936 smoke grenades, 1140 Tellermines, 1934 "S" mines. The nominal basic load of barrier material was: 306 rolls of K-roll (plain (unbarbed) concertina), 100 rolls of S-roll (barbed wire concertina, each 6-8 meters in length), 73 rolls of barbed wire, 21 rolls of plain wire, and 1550 sandbags). <sup>12</sup>

Staff (5 medium motorcycles, 4 heavy motorcycles with sidecars, 3 Kfz 1, 2 Kfz 2, 3 Kfz 15, 1 Kfz 31, 4 lt trucks, 6 medium trucks)

No.1 Company (*Oberleutnant* Besant (as of 15 April 42) authorized 12 LMGs, 1 PzBu39, 2 28mm PzBu41, 2 37mm PAK 36, 4 medium motorcycles, 10 heavy motorcycles with sidecars, 1 Kfz 1, 2 Kfz 2, 4 Kfz 15, 2 lt. Trucks, 18 medium trucks)

No.2 Company (*Hauptmann* Streitz assumed command of 220<sup>th</sup> Pioneer Battalion before the battle, authorized 12 LMGs, I PzBu39, 2 28mm PzBu41, 2 37mm PAK 36, 4 medium motorcycles, 10 heavy motorcycles with sidecars, 1 Kfz 1, 2 Kfz 2, 4 Kfz 15, 2 lt. Trucks, 18 medium trucks)

No. 3 Company (*Oberleutnant* Knees, arrived in North Africa in the summer of 1942, authorized 12 LMGs, 1 PzBu39, 2 28mm PzBu41, 2 37mm PAK 36, 4 medium motorcycles, 10 heavy motorcycles with sidecars, 1 Kfz 1, 2 Kfz 2, 4 Kfz 15, 2 lt. Trucks, 18 medium trucks), 850<sup>th</sup> Pioneer Sturm Company (re-designated 3/900<sup>th</sup> Pioneer Battalion, attached from *Panzerarmee Afrika*) further detached to SV 288)

one light pioneer column (authorized 5 medium motorcycles, 4 heavy motorcycles with sidecars, 1 Kfz 1, 2 lt trucks, 15 medium trucks, 2 compressors, 1 long wood trailer)

190<sup>th</sup> Panzer Signal Battalion (only one company on hand, apparently the battalion headquarters was not yet in North Africa, as of 20 OCT 42)

one panzer telephone company (newly raised 1 Aug 42, apparently not in North Africa as of 20 OCT 42)

one panzer radio company (190<sup>th</sup> Nachrichten Company, combat strength of 3/18/173 as of 20 OCT 42)

one motorized light signals supply column (newly raised 1 Aug 42, apparently not in North Africa as of 20 OCT 42) SV (Sonderverband, Special Unit) 288 (Oberst Daumiller (replaced Oberst Menton), attached, on 31 Oct. 42, re-designated Panzer Grenadier Regiment Afrika, a special unit with an assigned strength of 37/1042 (as of 22 Aug), assigned equipment included 6

# AXIS AIRPOWER<sup>25</sup>

Luftflotte 2: headquarters at Frascati near Rome, commanded by Generalfeldmarschall Albert Kesselring since 12 January 1940, with Generalmajor Paul Deichmann as Chief of Staff (since 25 August 1942) had 916 aircraft (of which only 528 were operational) in the entire Mediterranean Theatre) (In Outraged Skies, noted airpower historian Edward Jablonski (page 10) states, "Kesselring on paper may have appeared to have an impressive array of air power at his disposal. But as Commander in Chief, South, the about 3000 planes under his command were dispersed quite tenuously throughout the vast Mediterranean and the Balkans. And the new Fliegerfuehrer Afrika [General der Flieger Hans Scidemann since 30 August 1942 and located at Fuka], could count on little more than 600 of those rather widely scattered forces. On the eve of Montgomery's offensive he had about 380 fighters, of which most were Italian and only 165 Me-109Fs; he had about 150 bombers plus 75 Italian attack plane's and a few seaplanes and reconnaissance aircraft. But of these only about half were operational, thanks in part to the disruption of Axis supply routes into north Africa by Allied air and sea effort.")

II Fliegerkorps, commanded by Generaloberst Bruno Locrzer since 11 October 1939 and stationed at Taormina, with about 360 aircraft available (according to La Regia Aeronautica, 1939-1943, Volume Terzo, 1942 L'Anno Della Speranza: 35 Ju. 88s, 153 Bf 109 fighters, 27 Bf 109 fighter-bombers, 111 Ju. 87 Stukas, 18 Bf 110s, and 18 reconnaissance aircraft (a mix of FW 189s, Hs 126, and Bf 109fs), as well as about 40 support aircraft (medevae: Fi 156, Do. 17, Do. 24; Ju. 52 transports, W. 34 (communications), and FW 58 (liaison)). Of these, about 110 total aircraft were operational. However, The Italian Army Official History (Le Operazioni in Africa Settentrionale, Vol. III-El Alamein) reports 156 operational bombers and 58 operational fighters composed of four groups of ME-109s fighters and seven bomber groups, (six of JU-88s and one of HE-111s). This last source appears to include "cooperating" aircraft from X Fliegerkorps.

AXIS AIRCRAFT IN THE COMBAT ZONE\*

	AXIS AIRCRAFT IN	THE COMBAT	ZONE*
	CLASS OF	UNITS	TOTAL (ON-HAND, NOT
	AIRCRAFT		OPERATIONAL)
German (Combat aircraft)	Dive-Bombers	9 squadrons	95 aircraft
	Fighters	12 squadrons	125 aircraft
	Fighter-Bombers	9 squadrons	about 70 aircraft
	Reconnaissance	3 squadrons	29 aircraft
Subtotal (Combat aircraft)			About 320 aircraft
(thereof 50% operational)			160 aircraft
(support aircraft)	Desert rescue		10 aircraft
	Transport		15 aircraft
	Liaison		10 aircraft
	Courier		15 aircraft
Subtotal (support aircraft)			50 aircraft
Total (German)			370 aircraft
Italian	Fighters	1 wing	60 aircraft (30 operational)
	Fighter-Bombers	1 wing	60 aircraft (30 operational)
	Reconnaissance		10 aircraft (5 operational)
	Liaison		30 aircraft
	Transport		25 aircraft
Total (Italian)			185 aircraft (65 operational)
Axis Total			420 aircraft (155 operational)

<sup>\*</sup> Includes eastern Cyrenaika (except Benghazi and Tripoli), does not include "cooperating" aircraft of the X Fliegerkorps since they seem to have played only a minor role in operations Lightfoot and Supercharge.

<sup>&</sup>lt;sup>25</sup> As noted earlier for the ground forces, the numbers in this and subsequent tables may not necessarily tally up. The best source on the German Luftwaffe's order of battle is at http://www.ww2.dk/ with an extensive bibliography at: http://www.ww2.dk/bibliography.htm . See also La Regia Aeronautica, 1939-1943, Volume Terzo, 1942 L'Anno Della Speranza, by Nino Arcna, Stato Maggiore Acronautica, Ufficio Storico, Rome, 1984, pages 227-233. Regia Aeronautica, Vol. 1, A Pictorial History of the Italian Air Force, 1940-1943, by Christopher Shores, ISBN 0-89747-060-5, Squadron/Signal Publications, 1976, page 43. Le Operazioni in Africa Settentrionale, Vol. III-El Alamein, by Mario Montanari, Official History, Rome, 1993, page 657. "The Campaign in North Africa 1941/3, Volume 2, The Campaign in the Year 1942," by General der Panzertruppe Walther Nehring, MS # T-3, Foreign Military Studies, Headquarters, US Army Europe, 1948, Anlage 12. Die deutsche Luftwaffe im Afrika-Feldzug, 1941-1943, by Werner Held and Ernst Obermaier, Motorbuch Verlag, Stuttgart, 1979. "Der Einsatz der Luftflotte 2 (O.B. Sued) ab November 1941 bis zur alliierten Landung November 1942," by General der Flieger Hans Scidemann, MS # D-160, Foreign Military Studies, Headquarters, US Army Europe, 10 April 1947, pages 41, 42. "The Luftwaffe in Libya and Cyrenaica, (Oct-Nov 1942)," by Generalmajor Hans-Joachim Rath, MS # D-123, German title: "Der Einsatz der Luftwaffe im Rueckwaertigen Gebiet Libyen-Cyrenaika Oktober/November 1942," Foreign Military Studies, Headquarters, US Army Europe, pages 3, 4. Outraged Skies, by Edward Jablonski, contained in Airwar, Doubleday & Company, Garden City, New York, 1971, page 10, lists General der Luftwaffe Hoffman von Waldau as the new Fliegerfuehrer Afrika, however, it would appear that he only held this position from 12 April to 30 August 1942 when he became the commander of X Fliegerkorps and was replaced by General der Flieger Hans Scidemann. See also Desert Warfare: German Experiences in World War II, Alfred Toppe, Combat Studies Institute, US Army Command and General Staff College, Fort Leavenworth, Kansas, August 1991, page 27.

- Jagdgeschwader 27 (92 Bf 109 fighters (including 4 with the headquarters) commanded by Oberstleutnant Eduard Neumann since 10 June 1942, headquarters at based at Mumin Busak)

sea rescue squadron (Do. 24, based at Mersa Matruh)

Jahogruppe Afrika ("Fighter-Bomber Group Africa," organized 31 August 1942 with three squadrons of Bf 109 fighterbombers, based at Haggag el Quasaba East)

1st Squadron (formerly 10th Squadron, Jagdgeschwader 27)

squadron (formerly 10th Squadron, Jagdgeschwader 53, with 7 Bf 109F fighter-bombers as of 31 July 1942)

III. Gruppe, Jagdgeschwader 53 (33 Bf 109F fighters as of 1 October 1942, commanded by Hauptmann Franz Götz since October 1942, based at Quotaifiya)

7<sup>th</sup> Squadron 8<sup>th</sup> Squadron

9th Squadron

III. Gruppe, Zerstörergeschwader 1 (24 Bf 110A/F and 2 Bf 110D/E fighter-bombers as of 1 October 1942, by 31 October the Bf 110 A/Fs had been turned in and replaced with 17 Me 210As, commanded by Hauptmann Fritz Hobein since September 1942, based at Bir el Abd and Trapani)

7<sup>th</sup> Squadron

8th Squadron

- 9th Squadron (under X Fliegerkorps at Kastelli in late October 1942, drawing their new Mc 210s?)
- 8th Squadron, III. Gruppe, Zerstörergeschwader 26 (57 Bf 110 fighter-bombers, commanded by Hauptmann Georg Christl since 25 December 1941, headquarters with 10th Squadron, Zerstörergeschwader 26 at Kastelli Crete, 8th Squadron based at Barce/Derna)
- 10th Squadron, Zerstörergeschwader 26 (2 Do 17Z and 4 Ju 88C light bombers, based at Kastelli Crete)

12th Squadron, Experimental Bomber Wing (Ju. 88s, based at Barce/Derna)

1st Strategie Reconnaissance Squadron (F), Aufklärungsgruppe 121. (10 Ju. 88Ds as of 1 October 1942, based at

Fuka/Derna)

- 4th Tactical Reconnaissance Squadron (H), Aufklärungsgruppe 12. (12 Bf 109F, 1 Bf 109E, 1 Bf 110F, based at Bin el Abd)
- 2<sup>nd</sup> Tactical Reconnaissance Squadron (H), Aufklärungsgruppe 14, (received 5 Bf 109Fs during the October 1942, based at Bin cl Abd)

support troops (including: one air signal battalion and one logistical support team)

X Fliegerkorps, commanded by Generalleutnant Hofmann von Waldau (since 31 August 1942) with his Chief of Staff Oberst Sigismund Freiheer von Falkenhausen (since 1 April 1942), headquarters at Kiphissa near Athens), directed to "cooperate" with Fliegerfuhrer Afrika, many of his units had recently been withdrawn from Sicily and were now based in Greece)

- II. Gruppe, Kampfgeschwader 100 (27 He 111Hs and 1 Ju 88As as of 1 October 1942, commanded by Major Hermann Dickötter since 15 October 1942, based at Kalamaki near Athens with elements at Catania and Comiso)
  - 4th Squadron
  - 5th Squadron
  - 6th Squadron
- III. Gruppe, Kampfgeschwader 100 (12 He 111Hs and 18 Ar 196As as of 1 October 1942, Major Schulz since 20 September 1942 based at Salamanca and Kalamaki)

  - 7th Squadron 8th Squadron
  - 9th Squadron
- III. Gruppe, Zerstörergeschwader 1 (9th Squadron? Me 210s, based at Kastelli, Crete, reinforced by 16th Squadron, Kampfgeschwader 6 the Erprobungskommando ("Experimental Command") Me 210 and reassigned in October as 11th Squadron, Zerstörergeschwader 1)
- 2<sup>nd</sup> Squadron (F), Aufklärungsgruppe 123. (Strategic) (3 Ju. 86Rs and 12 Ju. 88Ds as of 1 October 1942, based at Kastelli, Crete)
- 2<sup>nd</sup> Squadron (Sec), Aufklärungsgruppe 125. (Ar 196s, based at Suda Bay, Crete)
- 3rd Squadron (Sec), Aufklärungsgruppe 126. (Ar 196s, based at Skaramanga, re-designated 9th Squadron, Kampfgeschwader 100 on 20 September 1942)
- Lehrgeschwader 1 (training unit, commanded by Oberst Franz von Benda since June 1942, headquarters at Eleusis and possibly at Iraklion, Crete)
  - I. Gruppe (Ju 88As, commanded by Major Joachim Helbig since 31 December 1941, based at Iraklion, Crete)
    - 1st Squadron
    - 2<sup>nd</sup> Squadron
    - 3<sup>rd</sup> Squadron
  - II. Gruppe (training unit, Ju. 88As, based at Iraklion, Crete)
    - 4th Squadron
    - 5<sup>th</sup> Squadron
    - 6th Squadron
  - IV. Gruppe (training unit, re-designated I. Gruppe, Sturzkampfgeschwader 5 on 27 January 1942 with 39 Ju 87Rs as of 1 October 1942, commanded by Major Erwin Schulz, based at Eleusis, Crete? Information on this unit is contradictory)

Regia Aeronautica (about 400 aircraft (26 Cant. 1007 Bis bombers, 30 SM.79 torpedo bombers, 107 CR.42 biplanes, 73 MC. 200 fighters, 60 MC 202 fighters, 43 G.50, 26 Cant. 501 and Cant. 506, and 23 Ca. 311. Of these, about 260 (65%) were operational. In addition, the Italians had about 50 auxiliary aircraft including the 103<sup>rd</sup> and 104<sup>th</sup> squadrons APC (with a mix of SM.79, SM.81, and Ca. 309 aircraft) and 145<sup>th</sup> Gruppo T. (with SM.82s) as well as three bomber groups (Cant. Z. 1007), one dive-bomber group (JU-87 Stuka), one fighter-bomber group (Re.2001), and three fighter groups (MC. 202) based in Sicily with a total of about 8 dive-bombers, 18 level bombers and 62 fighters which were operational)

Other squadrons, including some equipped with long-range fighters, were available to give direct support to the army. Axis air reconnaissance before the battle showed the following: 1) Area around Alexandria: 705 aircrafts of which 481 were fighters, 215 medium bombers, and 9 four-engine bombers. 2) Around Cairo-290 aircraft of which 179 fighters, 101 medium bombers, and 10 four-engine bombers. And 3) Around Suez-590 aircraft of which 186 were fighters, 400 medium bombers, and 4 four-engine bombers.

# APPENDIX K CHRONOLOGY OF EVENTS, 6<sup>th</sup> NEW ZEALAND BRIGADE ZONE 21 OCTOBER TO 1000 HOURS 24 OCTOBER 1942

DATE	TIME	EVENT
21 October	Late Afternoon	2 NZ DIV moves to Assembly Area
22 October		Gen. Montgomery's pre-battle message is read to the troops
	Night	8 NZ Fd Coy clears two 40yd lanes on Bottle Track
23 October	1700	10 AD closes on Assembly Area on Qattara Track
	2000	Tanks from 8 & 24 Armd Bde form up
	2100	NZ IN BNs form up on the LD (Line of Departure)
	2130	24 BN crosses LD, moves to 1 <sup>st</sup> barrage lift
	2140	8 <sup>th</sup> Army begins counter-battery fire
		-Sappers turn-on markers on routes through 8th Army minefields
	2200	Artillery begins timed concentrations
	2223	Barrage begins to move forward with 24 BN right behind it. They soon
		encounter 7 Co, 382 <sup>nd</sup> Grenadier Regt.
	2230	C & D Coy, 28 BN begin to advance
	2245	26 BN leaves Assembly Area
	2250	25 BN leaves Assembly Area
	2300	NZ 8 Fd Coy and 3 Fd Sqdn advances
	2320	3 Fd Sqdn's pilot vehicle immobilized by a mine
	2305	Lifting barrages ceases
	2505	-24 BN scizes intermediate obj. on PL Red
	2330	Route 'A' through 1st Axis minefield completed
24 October	0030	25 BN deploys on start line along PL Red
24 October	0040	26 BN deploys on start line along PL Red
	0055	Lifting barrage begins again
	0033	-No. 2 Section (8 Fd Coy) trips IED, 4 KIA, 12 WIA
	0140	15 min pause in lifting barrage while preplanned concentrations on
	0140	Miteiriya Ridge are fired
	0200	B/25 BN reaches what it believes to be its obj. and begins to dig in
	0213	6 Fd (Artillery) Regt program completed
	0222	4 Fd (Artillery) Regt lifting barrage completed
• • • • • • • • • • • • • • • • • • • •	0230	All four NZ breaches completed through 1st Axis minefield
	0230	Planned time under Opn Lightfoot for 2 NZ DIV to seize objs on PL
	0243	Oxalic
	~0300	HQ 26 BN reaches eastern slope of Miteiriya Ridge
	~0300	-9 Armd Bdc at 1st Axis minefield
	0330	Rifle Coys of 26 BN complete consolidation along PL Oxalic in the
	0330	sector of the II Bn, 382 <sup>nd</sup> Grenadier Regt
	0400	Planned time under Opn Lightfoot for 9 Armd Bdc to conduct Passage
	0400	of Lines through 2 NZ DIV
		-Breaches of 2 <sup>nd</sup> Axis minefield along Routes 'A' & 'B' begin
		-BG Gentry moves forward
	0430	-10 AD abandons 'Hat' Track
	0500	-Breaches on Routes 'A' & 'B' completed
	0500	-Royal Warwickshire Yeo Regt begins attempt to pass tanks forward
	~0600	-Beginning of morning nautical twilight
	-0000	-leading sdqns, Royal Wiltshire Yeo Regt cross crest of Miteiriya Ridge
		in 5 NZ Bdc zone
	~0620	Sunrisc Sunrisc
	0630	3 <sup>rd</sup> Hussar Regt moves in reserve
	0800	The guns and panzers of KG Sud halt Royal Wiltshire Yeo Regt
*****		
	1000	26 BN casualties reach 100

# APPENDIX L BREACHING ACCOUNTS OF OTHER UNITS, DURING THE 2<sup>nd</sup> BATTLE OF EL ALAMEIN

# APPENDIX L, ANNEX 1 BREACHING OPERATIONS, XIII CORPS, OPERATION LIGHTFOOT

# By Christian Childs

#### **OVERVIEW**

### XIII CORPS

The mission of XIII Corps, under the command of Lieutenant-General Brian G. Horrocks, was to deceive the enemy, by convincing them that the main attack would occur in the south. This would prevent the 21<sup>st</sup> Panzer and Ariete Armored divisions from reinforcing the northern defensive positions. Montgomery also ordered Horrocks to avoid any tank casualties; Montgomery wanted all tanks available for follow-on operations. H-Hour was set for 2200 hours on 23 October.

From north to south the XIII Corps consisted of the 50<sup>th</sup> Division, 44<sup>th</sup> Division and 7<sup>th</sup> Armoured Division. The corps would have to breach two former British minefields from east to west, code named January and February. The minefields were about 3000 yards apart and extended to the foot of Gebel Himeimat (Map L1).<sup>2</sup>

The 44<sup>th</sup> would launch a supporting attack on the north flank of the 7<sup>th</sup> Armoured Division and breach one mine lane about 300 yards north of the 7<sup>th</sup>, which would clear two lanes about 100 - 200 yards apart (Sketch L1 and L2). In an independent operation, the Free French Brigade would capture Himeimat. The corps would conduct the entire operation behind an intense artillery barrage – first on positions behind January and then shifting to those behind February.<sup>3</sup>

The commander of the 7<sup>th</sup> Armoured Division, General Harding, planned to breach the minefields immediately north of Himeimat, and to capture Himeimat hill and the escarpment (a steep bluff similar to a butte in the American west), to the west. The carrier-mounted 44<sup>th</sup> Divisional Reconnaissance Regiment, task organized from the 44<sup>th</sup> Division, would breach the minefields. The 44<sup>th</sup> Reconnaissance Regiment was specially organized and trained for such a mission, and they would have priority of fires from all the artillery of the 7<sup>th</sup> and 44<sup>th</sup> Divisions. The Armored Brigades would establish bridgeheads on the far side of the minefields, and the 44<sup>th</sup> Division would follow-on and take control of them.<sup>4</sup>

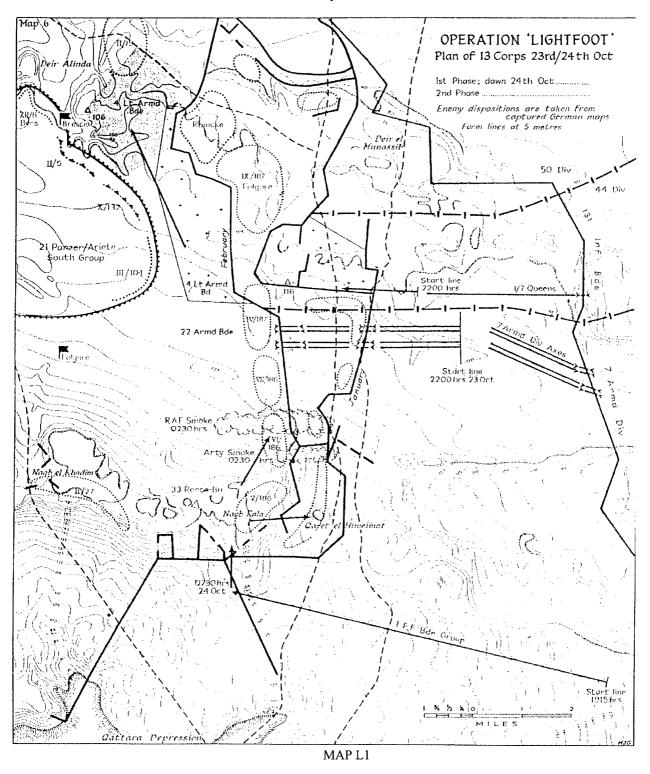

Since the panzerarmee knew that an attack was imminent; the best the Commonwealth forces could hope to do was confuse the enemy about the location of the main effort. General Montgomery implemented an intricate and comprehensive deception plan. General Horrocks describes some of the elements of this plan:

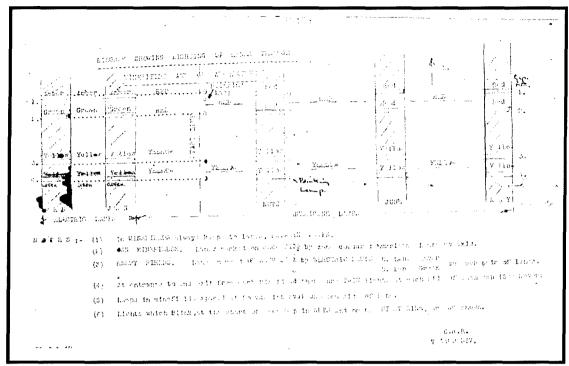

"Monty's very able staff, under the direction of Freddy de Guingand, worked out in detail the number and position of all vehicles and guns which would be required for the assault. These were concentrated in their proper places behind 30 Corps front very early on; but they were not the real operational vehicles. They were spares and, above all, dummies. Though the German aircraft photographed these concentrations constantly, they always remained the same, and there was no sudden increase just before the battle. As the assaulting divisions moved into position, their operational vehicles merely replaced the dummies, the change-over taking place, of course, at night.

In my sector dummy dumps and workshops began to spring up like mushrooms, all supplied by dummy pipelines and water installations. On the night of the attack it was arranged for the wireless sets of a complete armoured division to operate so as to suggest that large armoured forces were moving forward in this sector.<sup>5</sup>

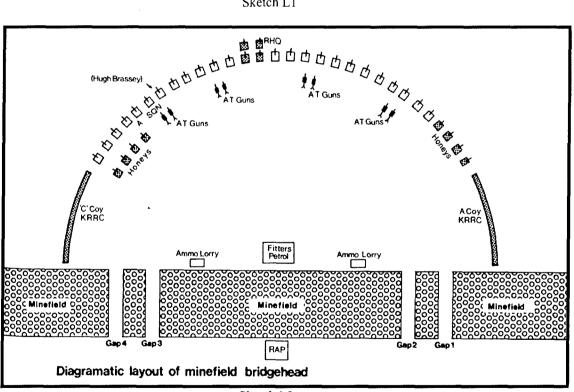

Montgomery created an intelligence cell, in the southern sector, to transmit reports specifically created for German listening posts. He also had a fuel pipeline built so slowly that German intelligence was completely deceived as to when it would be completed. Montgomery's deception was successful enough to conceal the arrival

of two new divisions with two hundred and forty guns and a hundred and fifty tanks. It thoroughly confused the Germans and made them think the attack would not be ready until the end of November. 6

Sketch L1

Sketch L2

### PANZERARMEE AFRIKA

The Italians anticipated taking the brunt of the initial attack. The typical offensive tactics of the Eighth Army were to locate the "weak" Italians, smash through them, and envelop the German units. At El Alamein, the XIII Corps would not be bothered with trying to locate the Italian units – there were no German-manned strong points in the forward area where they planned to conduct their breaching operations. In this case, the British did not underestimate their Italian opponents. The Italian 185<sup>th</sup> Folgore Division was a grounded paratroop unit that had "fought ferociously" against the 44<sup>th</sup> Division a few weeks earlier. The Desert Rats of the 7<sup>th</sup> Armoured Division described the Folgore as, "northerners and of higher quality than the average." The 21<sup>st</sup> Panzer and the Ariete Armored divisions had the mission of counterattacking any breakthrough or penetration of the Italian X Corps' main defensive line. 9

### INTO THE BREACH

In October 1942 the 22<sup>nd</sup> Armoured Brigade of the 7<sup>th</sup> Armoured Division was holding the line of two minefields, known as Nuts and May. Two other minefields, January and February, had been under Axis control since August. Each of these was about 300 meters deep. January was the furthest east, about 9 kilometers to the west of the XIII Corps line of departure. About 2,500 meters separated January and February in the area of the planned breaches. Both minefields extended south of Gebel Himeimat, a hill that overlooked the entire area where the battle would occur.

The 7<sup>th</sup> Armoured Division Commander planned to breach January and February immediately north of Himeimat, and send the Free French Brigade to capture the hill and the escarpment west of it. The 44<sup>th</sup> Divisional Reconnaissance Regiment would breach the minefields; they were specially organized and trained for this specific task (see Table 1). The armored brigades would pass through the breached lanes and establish bridgeheads on the

When the plan for "Lightfoot" became firm, it was decided to carry out an engineer reconnaissance of the line of advance up to the "January" minefield at the place where the breach was to be made... This reconnaissance had obviously to be made on the quiet. Any reconnaissance in force, or preliminary mine-clearing operation in front of "January" at this point would have given the game away, and defeated its object by leading the enemy to alter his minefield layout at the crucial point.

At dusk, a few days before the battle, a sapper officer from 44<sup>th</sup> Division, R.E., was dropped by armored car about a mile due east of Point A. He then walked and crawled on a compass bearing due west. The going was reasonably good until about 200 yards short of the minefield where the ground became broken. He got up to the minefield but could not see beyond as it lay on a slightly hump-backed ridge. On returning to the armored car in bright moon-light he was fired on, presumably by a patrol, but got back safely. The site seemed suitable; the broken ground might necessitate some work on the approaches, but it would provide some cover where it would be needed. There was risk, which had to be taken, that the enemy had added a "vertical" or cross minefield between "January" and "February" immediately opposite [the breach]. The width of the minefield at this point as originally laid was 300 yards." From "Engineers at the Battle of Alamein – the Southern Sector," pages 20-29.

Colonel J. M. Lambert, the Chief of Royal Engineers (CRE) for the 44<sup>th</sup> Infantry Division, described these minefields in some detail as follows: "From Alam Nayl to Himeimat ran two former British minefields named "January" and "February." These had been laid by us as defensive minefields during the previous spring; but on the enemy's arrival at Alamein he had captured them, together with Himeimat, and used them as his protective minefields. He was well dug in behind and between them and to a small extent in front of them. Of what additions or alterations he made to them we had little information. We had replaced them, so to speak, by laying two more parallel minefields (called "Nuts" and "May") about three miles to the east.

In Operation Lightfoot, therefore, the breaching of "January" and "February" seemed likely to be the main engineer tasks. We had no up-to-date knowledge of "February." Of the nearer "January" we knew the following:

a) The front fence of the minefield was still on its original alignment as surveyed in at the time we constructed it. The further fence, where it could be seen, also appeared to be intact and unmoved.

b) No material alterations to the mines appeared to have been made, at any rate near the front fence. All mines "stolen" to date had been British Mark IVs or E.P. (Egyptian Pattern) and none had been found trapped.

c) No anti-personnel mines had been found, other than a small number of Mark II shrapnel mines originally laid by us (most of these, incidentally, had become non-operative). No "S" mines had been discovered near the front fence-which was the enemy's favorite place for putting them.

d) The enemy laid tellermines on our side of the front fence to a depth of at least 300 yards. They appeared to have been laid at random in groups of up to five. They were just buried, sometimes only half buried, in patches of soft sand and unmarked. It seemed probable that every enemy patrol going out had been given fives mines and told to leave them lying about. (During the course of the battle more than 1,000 of these scattered mines were lifted—all were tellermines. No anti-personnel mines had been laid-for obvious reasons.)

c) The enemy's foremost defended localities were immediately in rear of "January" or possibly inside it in some cases. Some small posts dug just in front of it appeared to be occupied only at night.

f) There were no substantial barbed wire or other obstacles.

far side. The 44<sup>th</sup> Infantry Division would then take over. <sup>11</sup> Major R. H. W. S. Hastings describes the plan in more detail:

The plan, which was rehearsed three times, was for four gaps to be made in our own minefields [Nuts and May] by the Sappers twenty-four hours before the battle started. The next night the Brigade was to go through these gaps. The advance guard consisted of the 44th Divisional Reconnaissance Regiment, Battalion Headquarters [1st Battalion, The Rifle Brigade], "A" and "B" Companies of the 1<sup>st</sup> Battalion [The Rifle Brigade] and the Greys Jone troop of 3 Stuarts, Royal Scots Greys] – in that order... The 44th Divisional Reconnaissance Regiment, commanded by a 60th Rifleman, Lyon Corbett-Winder, was to make four gaps in January corresponding to those in Nuts and May. As soon as these gaps were complete "A" and "B" Companies were to push through and take up flanking positions - "A" to the north and "B" to the south - facing outwards and thus forming a corridor through which the 44th Divisional Reconnaissance Regiment could pass to repeat the gapping operation on February. The Grevs were to support the advance guard throughout and when the gaps were finally completed to take up positions on the other side of the last minefield, where the rest of the Brigade would join them. The 131st Infantry Brigade [44th Infantry Division] would then take over the Battalion's job between the minefields so that it could join the rest of the Armoured Brigade in their battle position to the west. The gaps around which all this activity centered were in two pairs - a pair in the north and a pair in the south, with about two thousand vards between pairs and some two hundred vards between gaps. The whole operation was to be supported by a barrage which was to creep forward two hundred yards ahead of the leading troops, a heavy barrage but not comparable to the tremendous uproar at the northern end of the line."1

The 132<sup>nd</sup> Brigade, 44<sup>th</sup> Infantry Division, had the follow-up role to the 131<sup>st</sup>. They would either pass through, or, if the 131<sup>st</sup> attack went well, open the salient wider. If the attack lost momentum the 132<sup>nd</sup> would consolidate any gains.

Table L1. XIII CORPS MINEFIELD TASK FORCE

	batteries of 8 guns
97 <sup>th</sup> Field Regiment Royal Artillery	Attached from division troops, 16 25-pdr guns, 2
	batteries of 8 guns

The 44<sup>th</sup> knew they were in for a tough fight with the Folgore to their front.<sup>13</sup> From north to south the Folgore was organized as follows: the 187<sup>th</sup> Brigade with the 2<sup>nd</sup>, 4<sup>th</sup> and 9<sup>th</sup> Parachute Infantry Battalions; Ruspoli's Group, made up of the 7<sup>th</sup> Parachute Infantry Battalion and the 8<sup>th</sup> Pioneer Battalion; and the 186<sup>th</sup> Brigade comprised of the 5<sup>th</sup> and 6<sup>th</sup> Parachute Infantry Battalions.<sup>14</sup>

The British began clearing lanes through their own minefields twenty-four hours before H-Hour. Units spent the rest of their time on the 23<sup>rd</sup> making final preparations, cleaning weapons and loading vehicles. <sup>15</sup> By 1830 hours the Army was prepared to start the attack. The Commonwealth forces moved west through their own minefields and waited for H-Hour. <sup>16</sup>

The operation began with a massive artillery barrage at 2140 hours. Major Hastings described the barrage as "the most impressive supporting fire that anyone had yet seen. The noise and the flashes were not to be forgotten." <sup>17</sup>

According to one soldier in the 2<sup>nd</sup> Battalion of the Buffs, "The barrage began. It was a shattering fantastic sound, drowning the subdued whispering of boots in the sand and the occasional clink of a rifle or bayonet as the infantry moved up. The din of over 1000 field guns firing along the front was like gigantic drumbeats merging into one great blast of noise." The Axis soldiers were subjected to "an inferno of explosions, smoke and dust. All communications were disrupted." The XIII Corps began to move forward toward the enemy minefields.

Countermine tactics and techniques would now help determine the outcome of the battle. The 44<sup>th</sup> Division was on the northern flank of the 7<sup>th</sup> Armoured Division. Their advance was led by sappers on foot whom would visually search for mines on a 12-foot front. They would remove the mines; the sappers' job was to find a clear route through the minefield. Behind the sappers were "Snails" – trucks fitted with diesel tanks over the rear tires. The diesel fed over the tires and onto the desert sand. The diesel left an indelible mark on the sand that could be seen by a truck driver, even at night. The trucks also proofed the safe lanes; by driving the trucks in echelon the tires covered the width of the path and hopefully detonated any mines the sappers had missed. The minefield breaching teams and the carriers of the assaulting battalion followed the Snails. Once the sappers breached January, the infantry would pass through and form a bridgehead from which they could begin to breach February or any other minefield.<sup>20</sup>

Two advance guards led the 7<sup>th</sup> Armoured Division toward January. These leading detachments had a pilot vehicle, Royal Engineer mine clearing party and a Scorpion. The Scorpion was a tank fitted with a flail. An auxiliary motor on the tank powered the flail, which was a rotating drum with chains attached. The spinning chains would beat the ground in front of the tank and detonate any mines in its path. The sappers drove the pilot vehicle until it struck a mine, which they assumed to be the leading edge of the minefield. They would then bring the Scorpion forward to begin the gapping drill. While the Scorpion flailed, sappers used detectors to widen and mark the cleared lane. Both advanced guards had a replacement party of sappers and Scorpion for leap-frogging, replacements or making additional lanes.<sup>21</sup>

The following account is from the XIII Corps Engineer Operations Report dated 26 November 1942:

The advanced guard for the 7<sup>th</sup> Armoured Division consisted of 44<sup>th</sup> Reconnaissance Regiment (under 22<sup>nd</sup> Armoured Brigade) who advanced in two columns, each of which included a Scorpion, and detachments of 4<sup>th</sup> Field Squadron sufficient to provide three detector parties with lifters and markers. Local escort was provided by a tank and carrier troop. The R.E. [Royal Engineer] Detachments had duplicate reserves (from 210<sup>th</sup> Field Company), and there were three spare Scorpions. The first encounter of mines was by a vehicle striking one. The Scorpions started thrashing, the detector parties sweeping on their right rear, to produce a gap 12 yards wide. It was subsequently evident that the first mine was one of a very scattered mine marsh, and clearing went on for about 900 yards before the main belt (300 yards wide) was met. Meanwhile the Scorpions had had many troubles, mostly from the tank engine and from hits by enemy shells. Bringing up new Scorpions caused delay. Progress was in fact so slow that the Scorpion engines did not overheat as had been feared."<sup>22</sup>

Running into these scattered mines significantly delayed XIII Corps' timeline; the units would not even begin to breach February until the next night.<sup>23</sup> General Horrocks, XIII Corps commander, received criticism for delaying his operations. However, his mission was to support the main attack in the north and Montgomery ordered him to avoid any tank casualties.<sup>24</sup> Horrocks had no need to boldly push through January and February.

The 22<sup>nd</sup> Armoured Brigade lost about 250 men (killed, missing and wounded), along with 30 carriers and a few tanks. The brigade left one damaged Scorpion within reach of the enemy patrols. On the positive side, the 22<sup>nd</sup> collected 400 Italian prisoners, mostly from the 185<sup>th</sup> Folgore Parachute Division.<sup>25</sup>

On 7<sup>th</sup> Division's right flank 1<sup>st</sup>/7<sup>th</sup> Queens of the 44<sup>th</sup> Division and a section of the 11<sup>th</sup> Field Company advanced as flank protection. They stumbled upon the same scattered mines. The sappers spotted the mines and the Snails marked the clear path, exactly as intended. Scorpions were having similar success, as well as a psychological effect on the enemy. Prisoners said they were less frightened by the artillery than by the "strange phenomenon – a slowly advancing pillar of dust, out of which came dreadful noises of clanking, grinding, and rattling chains." The

Scorpions, which were sustaining heavy casualties, helped the 44<sup>th</sup> Division's efforts by drawing enemy fire and attention to the south.<sup>26</sup>

The 7<sup>th</sup> Division reached the eastern edge of January at 2300 hours. They had stumbled into the scattered minefield and were now facing tough resistance from the Folgore. Major Hastings describes the fight through January:

The enemy brought heavy fire from artillery, mortars and machine guns to bear on those waiting for the gapping to be completed. "A" Company suffered casualties almost at once. Already the area was as crowded as the car park at Cheltenham Races, and there was no room anywhere to maneuver. At the end of half an hour "B" Company reported that No. 3 gap was impassable because of soft sand. In another twenty minutes No. 2 was nearly through, but was directly in the line of fire of an anti-tank gun whose flashes were identified by Colonel Freddie Stephens in the moonlight about two thousand yards away. He ordered up "A" Company's machine-gun platoon, who engaged the anti-tank gun with all four Vickers guns from their vehicles. The Italian gunners stopped firing at once. "A" Company went straight through the gap at the best speed they could make. They were then ordered to turn south and clear the western ends of gaps Nos. 3 and 4. "A" Company overran two enemy machine-gun posts almost at the end of their gap. But the situation remained. Progress in the southern gaps was slow and it was not until after half past one that "B" Company appeared at the end of gap No. 4."<sup>27</sup>

Axis counterattacks were highly effective. The Kiehl Combat Group of Panzerarmee Afrika, using captured Stuart Tanks, repulsed every attack. Battalions of the 104<sup>th</sup> Panzer Grenadier Regiment and artillery units of the 21<sup>st</sup> Panzer Division fought to a standstill, while the 10<sup>th</sup> Company held off a battalion-sized attack from the British 44<sup>th</sup> Division for twenty-four hours, between the mine belts. In one incredible example of devotion to duty, two German soldiers lay under the axle of a damaged anti-tank gun, allowing the gun to continue firing and destroy two tanks. The Ariete Division, Bersaglieri Battalion, and units of the Folgore Division fought "magnificently" and foiled any British breakthrough.<sup>28</sup>

The Commonwealth units did not reach their planned first-night objectives on the far side of February. In fact, they would get only to the far side of January. The 44<sup>th</sup> Divisional Reconnaissance Regiment and the 7<sup>th</sup> Division Sappers passed through January during the early hours of the 24<sup>th</sup>. The armored regiments passed through and established their bridgeheads just before sunrise.

The Free French Brigade passed on a piece of good news – they had gained a foothold on Himeimat (Map L2). This hill, defended by the Italian 14<sup>th</sup> Company, 5<sup>th</sup>/186<sup>th</sup> Parachute Infantry Battalion, was vital because it offered a commanding view of the area of operations.<sup>29</sup> The British artillery and the RAF dropped smoke rounds north of Himeimat, between the 6<sup>th</sup> and 7<sup>th</sup> Parachute Infantry Battalions of the 186<sup>th</sup> Brigade. The smoke obscured the breaches made by the 7<sup>th</sup> Armoured Division through January and prevented the Italians on the hill from seeing the operation or calling artillery fire on the British.

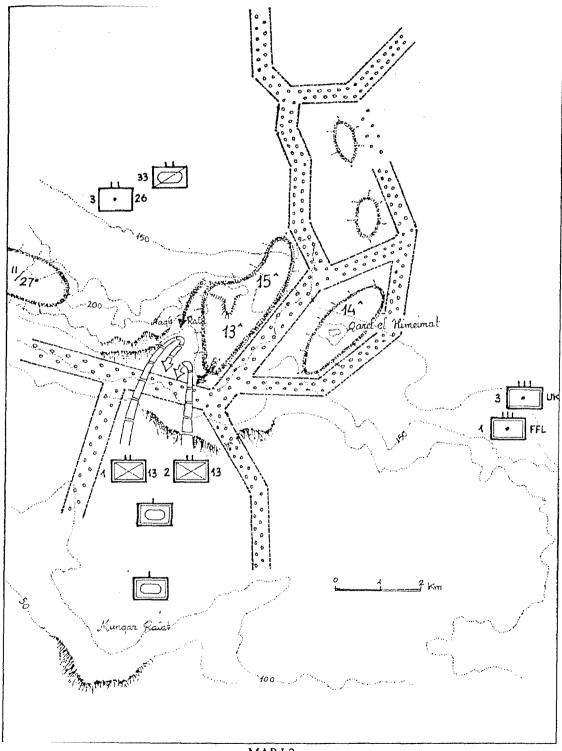

The Italians in front of the  $7^{th}$  Armoured Division provided a stubborn fight. The companies who took the brunt of the main attack were the  $6^{th}/2^{nd}$ ,  $24^{th}/8^{th}$ , and the  $19^{th}/7^{th}$  (Map L3). Major Paolo Caccia-Dominioni da Sillavenge, commander of the Italian  $31^{st}$  Pioneer Battalion, relates a story about a soldier in the  $7^{th}$  Parachute Infantry Battalion:<sup>2</sup>

Another of the 7<sup>th</sup>'s paratroopers, Leandro Lustrissimi, kept enemy tanks at bay with his flame-thrower for twenty-four hours. When he finally ran out of inflammable liquid, he continued to do what he could with petrol bottles, in spite of being wounded. Almost unconscious, he was taken prisoner. Then, however, he recovered somewhat and led his comrades in a furious hand-to-hand fight with their captors. They managed to free themselves and re-occupy their position. Then a group of tanks came on the scene. With his bare hands Lustrissimi dug up a mine and flung it

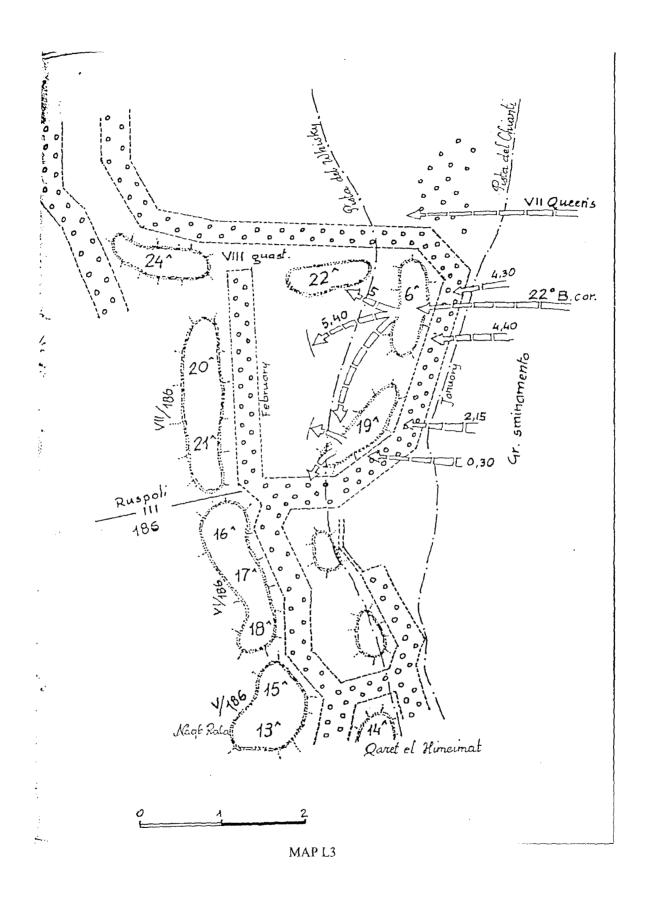

\_

<sup>&</sup>lt;sup>2</sup> Caccia-Dominioni, 235. The maps in the official Italian history show the 22<sup>nd</sup>/8<sup>th</sup> rather than the 24<sup>th</sup>/8<sup>th</sup> almost directly behind January. The map shows the 24<sup>th</sup> behind February on 24 October.

beneath the leading enemy tank. He was himself killed by the explosion. He was twenty-four years old and came from Subiaco."  $^{30}$ 

MAP L2

When sunrise came the soldiers of the 7<sup>th</sup> Armoured Division were digging in between January and February.<sup>31</sup> Attempting to breach February would be too costly during the daylight. The enemy was alerted and had a general idea where the British would make their assault. This was compounded by the unfortunate news that a German counterattack, led by the 33<sup>rd</sup> Panzer Reconnaissance Battalion, had driven the French from Himeimat. General Harding, the Division Commander, decided to resume the attack that night. Axis artillery pounded the tanks and infantrymen all day long.<sup>32</sup> The division had two functioning Scorpions for that night's operation.<sup>33</sup>

The Italians asked for a truce that evening to collect and bury their dead; the British refused. Major General G. L. Verney describes the 7<sup>th</sup> Armoured Division's experiences on the 24<sup>th</sup> and 25<sup>th</sup>:

The 131<sup>st</sup> (Queens) Brigade [from the 44<sup>th</sup> Division] was put under command of the Division for the night's operations and two battalions, the 1<sup>st</sup>/5<sup>th</sup> and 1<sup>st</sup>/6<sup>th</sup> Queens Royal Regiment, quickly secured a bridgehead west of the second enemy minefield, "February." Then troubles began. The infantry were pinned to the ground by the enemy's fire, and efforts to clear the lanes for the armour proved slow and costly. At last two gaps were reported clear, and the 4<sup>th</sup> CLY (Clyde and Lotharshire Yeomanry) and the 1<sup>st</sup> Royal Tanks moved forward. Both Regiments immediately began to lose tanks and in view of the instructions that General Harding had had, there was no alternative but to make no further attempts to move the armour through, so he decided to hold the ground gained with the 1<sup>st</sup> Rifle Brigade and the two Queens Battalions with an armoured regiment in support.<sup>34</sup>

The 1/5<sup>th</sup> and 1/6<sup>th</sup> Queens were now dug in "precariously" on the western side of February. They suffered very heavy casualties during the attack, many of which were attributable to 'S' mines, which Axis engineers had liberally scattered throughout the minefield.<sup>35</sup> MG Verney continues his description of the 7<sup>th</sup> Armoured Division's actions:

On the morning of the 25<sup>th</sup> the Corps was ordered not to press this attack in the southern sector. In the afternoon, the 4<sup>th</sup>/8<sup>th</sup> Hussars, who were covering the right flank of the Division, were ordered to advance north-westwards in support of operations by the 50<sup>th</sup> Division on the right. Almost at once they ran into minefields covered by anti-tank guns and began to lose tanks, so this operation also had to be called off.<sup>36</sup>

According to the maps from the official Italian history, the  $7^{th}/186^{th}$  Parachute Infantry Battalion repelled this attack.

Vehicles and soldiers crowded the area between January and February throughout the afternoon of the 25<sup>th</sup>. They were completely exposed to the heavy and continuous artillery from the Italians.<sup>37</sup> The Folgore received considerable artillery support from the 1<sup>st</sup>/3<sup>rd</sup> Light Duca d'Aosta, the 3<sup>rd</sup>/1<sup>st</sup> Light Eugenio di Savoia, the 3<sup>rd</sup> and 4<sup>th</sup> of the 26<sup>th</sup> Pavia Artillery and the 1<sup>st</sup>/21<sup>st</sup> Trieste Artillery. By the end of the battle the Folgore claimed 120 damaged and destroyed British tanks and more than 600 casualties from the XIII Corps.<sup>3</sup> Folgore soldiers used Molotov cocktails extensively against the British armor because of the ineffectiveness of the 47/32 anti-tank gun that, in one instance, needed 20 hits to record one kill! The British were able to recover many of their tanks from the battlefield because the Italian engineer commander did not follow orders to destroy the immobilized enemy tanks.<sup>38</sup> As for the Folgore's casualties, their field-grade officers suffered 9 KIAs and 4 WIAs out of 18 assigned.

Over the next few days the 44<sup>th</sup> Division, reduced to the 132<sup>nd</sup> Infantry Brigade, assumed responsibility for the front. The 7<sup>th</sup> Armoured Division, including the 22<sup>nd</sup> Armoured Brigade and the 131<sup>st</sup> Queens Brigade (recently attached to the 7<sup>th</sup> Armoured Division) became supporting units in the north in preparation for Operation Supercharge. The 4<sup>th</sup> Light Armoured Brigade remained in the south, but soon rejoined the 7<sup>th</sup> Armoured Division.<sup>39</sup>

<sup>&</sup>lt;sup>3</sup> Caccia-Dominioni, 234-236. According to the official British history, 31 British tanks were lost. It would appear that the Italians either inflated the number or they counted the armored infantry universal carriers as "tanks."

Five days later the 44<sup>th</sup> Division finally broke through February, the scattered mines on the western side and the minefield eight miles further away. 40 George Greenfield, an officer in The Buffs (2<sup>nd</sup> Battalion, Buffs Regiment, assigned to the 132<sup>nd</sup> Infantry Brigade), gives a vivid description of the "breakthrough:"

There were only two narrow gaps through the minefields in front of us allotted to The Buffs, and vehicles were ordered to go through one at a time in longish intervals between, just in case the Luftwaffe managed to raise a Stuka or two for a sneak raid. So it was a long and tedious business getting the hundred or so vehicles through the minefields.

Too long and tedious for the Free French, who were to follow us through. A squadron of them in Bren gun carriers formed up in a line abreast at about 10-yard intervals along the edge of the minefield. There was no question of bothering about gaps where the mines had been lifted. Their leader blew a blast on his whistle and the column charged into the minefield. There were thunderclaps of bangs and crashes as one Bren gun carrier after another blew up. Some went up within the first few yards; a few dodged their way ahead for 50 yards or more. But one after the other, with inevitable doom, the carriers smashed themselves to grounded hulks on the mines. It was magnificent and it was futile, a fitting epitaph to a famous victory."<sup>41</sup>

# APPENDIX L, ANNEX 2 9<sup>th</sup> AUSTRALIAN DIVISION BREACHING OPERATIONS DURING OPERATION LIGHTFOOT\*

When the hour for action was drawing near, a throbbing, at first half imagined, then faintly heard, stole through the night and grew into rhythmic, surging sound. The bomber aircraft that were to support the army's assault approached from the east and passed over. A few distant points of light then flickered unimpressively from the desert on the British side; they came from the muzzles of the long-range guns opening up in advance of the shock moment so that their first shells would fall in the same split second as those from the massed field artillery. In an instant, at the stroke of 9.40 p.m., flashes from hundreds of guns were seen sparkling in a long line across the desert.

For fifteen minutes the counter-battery bombardment continued unabated. Suddenly the guns were silent. There was a breathless stillness, as if their force was spent. Above the Eighth Army's hidden battle array two searchlights pointed long, still fingers into the sky. Five minutes passed. At 10 p.m. the two beams swung inward, intersected and stopped, forming a pointed arch dimly seen in the moonlit vault, like a remote symbol of crossed swords. At that instant the British guns opened a barrage of unimaginable intensity, eclipsing their first performance, and to the urgent drumming of the guns the infantrymen stepped out from their start-lines in slow, measured paces at the even rate of 75 yards per minute.

Well practiced in exercises in keeping to the exact speed required, the infantry maintained, as they advanced, a straight extended line on either side of their company guide group, which set the speed and direction. In the centre line with stakes driven in at intervals of 100 yards, on each of which was placed a rearward shining torch emitting a colored beam; various colors were used to differentiate the centre lines of different units. Later the road for following tanks and vehicles would be taken along, the centre line to the left of the stakes. The signalers meanwhile were running their lines forward well to the right of the stakes, to be clear of later vehicle movement. Not far behind the guide parties the engineers followed, ready to come right forward as soon as a minefield was struck, and instantly to commence clearing a gap. Farther back again were other groups which, as they advanced, established traffic control points which would later be in direct communication with battalion headquarters and would control the movement forward, as required, of tanks or vehicles carrying ammunition and consolidation stores. An efficient administrative machine was set in motion behind the infantrymen as they moved into the fight.

Right along the front of the XXX Corps the enemy's front-line defenses were breached and the objectives for the first phase successfully taken but it was soon found that the job of minefield clearance was much bigger than expected.

On the extreme right of the corps attack the 2/24<sup>th</sup> Battalion (Lieut-Colonel Weir) advanced with two companies--- Lieutenant McNamara's on the right and Captain Serie's on the left. One small minefield was encountered on the start line and cleared without difficulty. The enemy soon opened defensive fire with mortars and machineguns and one of the supporting 25-pounders was dropping its shells short. At 10.30 the two companies reached the minefield while the artillery concentrations were still falling just beyond and went to ground until the barrage lifted while the engineers came forward and blew gaps in the wire with bangalores.

Meanwhile the sappers were working feverishly to clear lanes through the minefields so that anti-tank guns and vehicles laden with ammunition, mines and consolidation stores could be got forward. At 11.20, after 35 minutes work under fire, two eight-yard gaps had been cleared in the first minefield but ten minutes later another field of five rows was met. Enemy artillery and mortar fire was heavy and some sappers were hit, but by 12.5 a.m. gaps had been completed. This was the main field but farther on two more fields were found and had to be gapped.

\* Extracted from <u>Tobruk and El Alamein</u>, by Barton Maughan, Australian War Memorial, Canberra, 1966, pages 665-728.

In the first phase the 20<sup>th</sup> Brigade attacked with the 2/17<sup>th</sup> (Lieut-Colonel Simpson) on the right and the 2/15<sup>th</sup> (Lieut-Colonel Magno) on the left. Major Brien's company on the right of the 2/17<sup>th</sup> (which attacked with three companies forward) met heavy opposition and many men were hit, including Brien himself, mainly while overcoming two strong positions. One of these was knocked out and the occupants killed by a section of four men led with great dash by Corporal Harris. (Though hit in both thigh and shoulder Harris continued to lead his section until the following night when he was again wounded.) Lieutenant Hannaford took command of Brien's company and the men reached their objective on time. The centre company and the left one too reached their objectives without excessive casualties; by this time the battalion had lost 15 killed and 47 wounded and 14 others were not accounted for.

The 2/15<sup>th</sup> on the left took its intermediate and final objectives with relatively light losses but the audacious Captain Cobb, whose company was leading on the right, was among those killed. In all 5 were killed and 40 wounded.

The sappers with the 2/17<sup>th</sup> did not have undue difficulty in making gaps in the minefield but the area through which the 2/15<sup>th</sup> advanced was found to be alive with anti-personnel and anti-tank mines and it was not until 12.30 a.m. that a lane had been cleared.

The success of the XXX Corps' attack for the first phase augured well for the second, but it was soon to be found that the first line of defense which on British maps of enemy defenses had bristled with obstacles and weapons of every kind was but a comparatively lightly held outer line to cover the main line of defense sited in rear at considerably depth.

On the right flank the 2/48<sup>th</sup> Battalion (Lieut-Colonel Hammer), coming up along the 2/24<sup>th</sup>'s centre line, had seen the 2/24<sup>th</sup>'s success signal go up just before it reached its start-line for the second phase. At 12.38 the battalion began to advance with two companies forward - Captain Robbins' on the right, Major Edmunds' on the left--towards the enemy's second line of defense. The defenses were wired, mined and booby-trapped but these obstacles were efficiently dealt with. At first there was stiff resistance. In Robbins' company Lieutenant Lewin was hit. Sergeant Kibby took over the platoon and Robbins ordered him to attack a troublesome enemy post holding up the advance and pinning down Kibby's platoon. Kibby promptly dashed forward firing his Tommy-gun and silenced the post, killing three men and taking the surrender of 12 others. The advance was resumed.

The forward companies halted 2,500 yards from the start-line and the rear companies (Captains Bryant and Shillaker) passed through and advanced to the objective 1,400 yards farther forward. The smoke and dust raised by the bombardment had formed a dense pall and the Bofors guns, firing four rounds every five minutes along the centre line, were a great help. The success signal was sent up at 3.45 a.m. The 2/48<sup>th</sup> had advanced 3,900 yards from its own start-line and 6,900 yards from the brigade start-line. Patrols sent out to cover reorganisation met no opposition; but although Major Edmunds' company had established contact with the 2/13<sup>th</sup> Battalion on the intermediate objective the companies on the final objective could find no sign of the 2/13<sup>th</sup> on their left.

The 26<sup>th</sup> Brigade's attack on the Eighth Army's northern flank had succeeded brilliantly. Reorganisation to form a firm front to the flank was at once put in hand. The ground on which the companies dug in on the northern side was for the most part beyond the boundary of the objective prescribed in the orders. In the 2/48<sup>th</sup> Robbins' company on the right faced north, Bryant's company, which was the right corner peg of the Eighth Army's new front, faced both north and north-west and on its left Shillaker's company faced west. On Shillaker's left flank, however, the ground was still held by the enemy. Meanwhile the toiling engineers had been unrelentingly pushing their mine-free lanes forward through ground constantly harassed by fire from the enemy's un-attacked positions opposite the northern flank. As soon as the way was clear Major Tucker brought in the vehicles with consolidation stores, and the men, toughened by Hammers's hard training policy, put up a tremendous effort to get the often rehearsed job done. 'We were perfectly reorganised by dawn,' wrote hammer, in his report of the battle, & with 2,400 Hawkins laid and dug-in very solidly.' All supporting weapons were in place and all men dug-in with galvanized-iron overhead protection against airburst.

The 2/24<sup>th</sup> Battalion, which had been not quite so pressed for time, had also reorganised facing north, pushing the left-rear company (Harty's) forward and left into the gap between the 2/24<sup>th</sup> and the 2/48<sup>th</sup> and likewise pushing out the right-rear company to cover the right flank beyond which the composite force had established its strong-points in the old no-man's land to link with the coast sector defenses.

Lieut-Colonel Macarthur-Onslow's composite force was in position by 2 a.m., and digging in on a line 3,500 yards on through East and West minefield begun by the 2/3<sup>rd</sup> Pioneers on the two nights before the battle Point 24 and farther west. Six posts had been established and finished on the 23<sup>rd</sup>-24<sup>th</sup>. There was no interference by the enemy except for some artillery fire.

The 20<sup>th</sup> Brigade's task in the second phase was assigned to the 2/13<sup>th</sup> Battalion (Lieut-Colonel Turner), with the 40<sup>th</sup> Royal Tank Regiment in support. Unlike Hammer, Turner had no open flank and did not have to worry about holding a long front to the north, but his battalion had to advance to the same depth as Hammer's and on a wider front - 2,400 yards as against 800. Having regard to what was known of the enemy defenses, Turner had allotted in each phase a frontage of 900 yards to the right company and 1,500 yards to the left. The frontages were too great to be effectively covered by a straight infantry company attack, so various strong-points selected from the overprint maps were given as special tasks to platoons and fighting patrols. The attack had been rehearsed as one of cooperation between infantry and tanks, tanks being needed to help mop up so wide an area. It had been expected that the main minefield to be traversed in the first phase of the corps attack would be 250 yards deep and the plan allowed for this (and more) to have been cleared before the second-phase attack began. However, the route to the start-line of the 2/13<sup>th</sup> and 40<sup>th</sup> RTR was traversed by many secondary minefields so that mines had to be cleared for almost 1,600 yards. The lanes could not be made ready for the tanks despite Herculean efforts by Major Gehrmann's 2/13<sup>th</sup> Field Company, so the battalion attacked on time but without the tanks.

In the first 1,700 yards Captain Handley's and Captain Cribb's companies encountered as expected only small outposts, from which the occupants made off, with the exception of one strongpoint which Sergeant Carson's platoon had been detailed to attack. Carson led out his platoon on the required bearing to the post, which was overcome with grenades and the bayonet, contacted the 2/48<sup>th</sup> on his right, and then had his platoon ensconced in an adjoining position. Having heard enemy fighting on the left he set out to find his company headquarters, encountered a German post and single-handed captured nine German prisoners.

Meanwhile, from Captain Cribb's company on the left, Sergeant Easter had set out with his platoon to contact the neighboring Gordon Highlanders and take part in a joint attack with that battalion on a strong post and anti-tank gun locality on the inter-divisional boundary. Much later, Easter returned to report that he had contacted the Gordons and led his platoon with them in an attack on their next objective, which, however, did not succeed.

By 3 a.m. Captain Wilson's company and Captain Sanderson's had passed through, but still the tanks had not got forward. These companies came up against the enemy's defense line and soon met intense fire from the front and flanks and suffered heavy losses.

Wilson's company ran into crossfire from a line of German posts. Soon Wilson and the commanders of two of his platoons were wounded and their platoons pinned down. The third platoon, led by Lieutenant Pope, charged and overcame one post whereupon some of the enemy shouted in English, as a ruse, 'Hold your fire. We are coming.' The Australians ceased fire whereupon some Germans ran back and re-occupied some of the positions. Lieutenant Treweeke took command of the company and twice attacked the nearest centre of resistance, succeeding on the second attempt in overcoming it; 12 Germans were killed and 23 surrendered. Treweeke decided to wait until the tanks came tip before continuing the attack.

Sanderson's company, on the left, had also been in a fire-fight and taking casualties. Sanderson saw some Germans approaching as if they wished to surrender, ordered his men to cease fire and stood upright. He was immediately shot down. Lieutenant Norrie, though wounded, took command and ordered the men to assault but as he led them forward was also killed. Lieutenant O'Connor, also wounded, took over and after calling for volunteers led 12 men from his platoon against one of the posts. After hand-to-hand fighting the post was overcome, but not before O'Connor had been wounded again, this time mortally. Nearly all the NCOs had been

killed or wounded and the survivors, under the only remaining officer, Lieutenant Bissaker, were withdrawn to the intermediate objective where Captain Cribb later absorbed them into his company.

Meanwhile, Colonel Turner had sent Captain Cribb back to bring up the tanks. Brigadier Wrigley warned the 2/17<sup>th</sup> to have two companies ready to move forward to help the 2/13<sup>th</sup> but when it became evident that they could not reach the area before daylight, the 2/13<sup>th</sup> was ordered to dig in where it was. At dawn the forward companies which were skylined on a slight crest came under heavy fire and were forced to withdraw to dead ground a short distance back. Soon the tanks arrived in line ahead. The infantry pointed out the troublesome posts that were still un-subdued nearby and the tanks promptly destroyed them.

While the attack had been proceeding, the 24<sup>th</sup> Brigade had carried out its diversionary operations. Just before midnight a group of 50 dummies which had been earlier placed in no-man's land forward of the 2/43<sup>rd</sup> and 1,000 yards from the enemy's forward positions were raised by remote control and illuminated from time to time by sweeping searchlights to simulate men moving in to the attack, so as to invite retaliatory fire, which the enemy brought down in abundant measure.

A reinforced platoon of the 2/43<sup>rd</sup>, under Lieutenant Thomas, set out to raid enemy positions east of Kilo 110. After covering 600 yards under increasingly intense fire the patrol blew two gaps in the enemy wire, penetrated to its objective and there destroyed an anti-tank gun and inflicted about 30 casualties. After the withdrawal had been ordered, Thomas and two others were hit. Lance-Corporal Bingham (2/3<sup>rd</sup> Field Company) began to carry Thomas out. On the way, Bingham shot a German with this pistol then bailed up three others who helped him carry Thomas back. A total of five German prisoners were brought in; one Australian was killed, 8 were wounded and 7 were missing.

From Trig 33 the 2/28<sup>th</sup> sent out a raiding party 34 strong. Lieutenant Barnes' platoon with sappers and others, advancing under fire and in the light of flares, broke through several belts of the enemy's wire and reached its objective. There one forward section got into the strongly-wired enemy post and silenced a machine-gun, but the other failed to break through the wire. Barnes, who had been seriously wounded, ordered a withdrawal. Sergeant Moore took command and ably organized the rescue of the wounded and withdrawal of the survivors. The stretcher-party carrying Barnes was later hit by a mortar bomb and the stretcher was smashed, but Barnes managed to make his own way back. Moore organized a rescue party and brought in other wounded. Of the 34 men on the raid, 3 had been killed and 9 wounded. Two were missing.

The 24<sup>th</sup> Brigade's operations achieved their aim of drawing artillery fire, which came down on them for four hours. Prisoners taken later in that sector declared that they thought that they had defeated part of the main attack.

In the attack so far the 9th Division had taken 127 German prisoners, all from the 1/382<sup>nd</sup> Battalion and 264 Italians mainly from the I and III Battalions of the 62<sup>nd</sup> Regiment.

Elsewhere on the XXX Corps front the assaulting infantry had had similar experiences to those of the Australians. The first objectives were taken in about two hours without great opposition but again minefields proved to be much more extensive than expected and the strongest resistance was encountered in the second line.

When the sun lit up the desert on the morning of the 24<sup>th</sup>, the enemy, if he had been able to observe the situation clearly through the battle-fog and tumult, would have seen the front of the 9<sup>th</sup> Australian and 51<sup>st</sup> Highland Divisions in the shape of a bay between two headlands. Southwards from where the 26<sup>th</sup> Brigade's positions jutted out on the extreme right flank, the front-line receded across the front of the two divisions but came out again on the New Zealand front where it remained out beyond the corps' objective--the Oxalic line--in front of the Miteiriya Ridge until the left New Zealand battalion was reached, when it again receded in front the Oxalic line on the New Zealand division's left flank and across the South African division's front to come out again to the objective on the left flank of that division and of the XXX Corps' bridgehead. All along that front the infantry were waiting to meet the expected armoured counter-attacks. The armour of the X Corps had failed to get out beyond the Oxalic line to place itself astride the enemy's supply routes in a challenging posture.

On the first night of the battle, the Eighth Army had not accomplished what its commander had ordered. Only one of the three bridgeheads for the armour had been secured and cleared of mines to the prescribed depth, and that too late. None of the three armoured divisions had pushed through to the enemy's rear. Only one had made an attempt to do so.

Montgomery's second plan was less ambitious than the discarded first plan. The change had been made, he declared, because his troops were insufficiently trained for the tasks he had set them. But the assault forces were well trained for the tasks they were given on the night of 23<sup>rd</sup> October, and fully rehearsed. No troops could have been better spirited. Montgomery had seen to that himself. What the orders prescribed and the forces faithfully and with great sacrifice strove to do was not accomplished because the tasks Montgomery had laid on the infantry divisions and minefield task forces of the armoured divisions for that night were still too great for them to undertake. That, at least, was an opinion held afterwards at XXX Corps Headquarters.

On the morning of the 24<sup>th</sup> the attention of the armoured commanders, the corps commanders and the army commander himself was attracted to the Miteiriya Ridge sector where the Oxalic Line had been reached and lanes for the passage of armour cleared. General Freyberg, forward in his tank in the early morning, was perturbed at the reluctance of the 10th Armoured Division's tanks to push forward. Unable to contact Lumsden, he sent a message to Leese, who thereupon came forward to see Freyberg. Leese and Freyberg reconnoitered the front together and then returned to Freyberg's headquarters to confer by the "blower" with Montgomery. There Lumsden soon joined them, having seen nothing that morning, it may be presumed, to diminish his dislike of issuing in line ahead through minefield lanes to attack an enemy gun-line. Freyberg, whose counsel the higher commanders probably valued more highly than anybody's, thought that the attack should be resumed that night, which may have helped the corps commanders to reach the same conclusion. Montgomery probably needed no prodding to decide that the risks could, should and would be accepted. Montgomery told Lumsden that the 10<sup>th</sup> Armoured Division was to get out into the open and manoeuvre beyond the Miteiriya Ridge.

In outline, Montgomery's orders of the continuation of the battle were, with some modifications, to carry out by the morning of the 25<sup>th</sup> such of the tasks ordained for the 24<sup>th</sup> as had not been completed. The 9<sup>th</sup> Australian and 51<sup>st</sup> Highland Divisions were to secure the rest of the Oxalic line, the armour was to debouch by night and advance to the Pierson bound. The action of the armour, however, was not to be dependent on completion of the infantry tasks - the armoured divisions were to fight their own way forward. The 1<sup>st</sup> and 10<sup>th</sup> Armoured Divisions were to advance westwards, the 9<sup>th</sup> Armoured Brigade and the New Zealand division's cavalry (armed with Honeys) southwards, all four armoured brigades to link on the Pierson bound. The thrust of the 9<sup>th</sup> Armoured Brigade was to prepare the way for later southward infantry thrusts by the New Zealand division. The 133<sup>rd</sup> Lorried Infantry Brigade from the 10<sup>th</sup> Armoured Division was to take over the part of the New Zealand front adjoining the Highland division. De Guingand later recorded that Lumsden was "obviously not very happy about the role his armour had given" and Montgomery wrote that he told Lumsden to "drive" his divisional commanders. In the XIII Corps the 44<sup>th</sup> and 7<sup>th</sup> Armoured Divisions were also to carry out their tasks uncompleted on the first day.

By daylight that morning, the 9<sup>th</sup> Division's front had erupted with fire of every kind - fire from field guns, machine-guns, mortars and snipers directed at the infantry, high velocity fire aimed at the tanks, and fire from British tanks and guns in rear engaging targets. The pandemonium was to continue - with some periods of great intensity - for several days.

Soon after sunrise the forms of enemy tanks could be seen approaching from the west. The German 15<sup>th</sup> Armoured Division was coming in to make its first attack on the bridgehead. By 7.15 a.m. the tanks were reported about 1,000 yards west of the 2/48<sup>th</sup>'s left forward company and also forward of Trig 33. The battle fire quickened. Soon the three Australian field regiments and the 7<sup>th</sup> Medium Regiment were firing pre-arranged concentrations on the areas into which the German tanks had moved and some Shermans in rear of the Highland division's front and of the left flank of the Australians' front were also engaging them. A little later lorried infantry appeared west of the 2/48<sup>th</sup>. In time, the enemy armour drew back from its first encounter with the XXX Corps artillery and the Shermans' long-range gunfire, leaving several tanks burning on the battlefield. Some Shermans were also burning.

On the northern flank the prospect at daylight had at once revealed that the tactical key to the security of the flank was Trig 29, north of Hammer's battalion. Whitehead's brigade, by comparison with other fronts, was faced by a less subdued enemy infantry, which the main artillery storm of the night assault had by-passed. Enemy artillery to the north was also active though most of its shelling was behind the forward battalions, but soon the enemy began patrolling to find the flank of the penetration.

Meanwhile, sappers were busy throughout the day widening lanes, bringing the diamond, boomerang, double bar and square tracks up to the foremost localities and clearing minefields from congested areas. In the evening hot meals were brought right up to the forward troops.

At 4 p.m. the commanding officer of the 2/13<sup>th</sup> Battalion, Colonel Turner, and the adjutant, Captain Leach, were wounded, Turner mortally; both had to be evacuated. Major Colvin was promptly brought forward to take over and, on the way, received orders from Brigadier Wrigley for the renewed attack up to the Oxalic line, which was to open at 2 a.m. next morning. The 20<sup>th</sup> Brigade was to capture the ground originally assigned to the 2/13<sup>th</sup> on the first night, but the task was now to be carried out by two battalions, the 2/16<sup>th</sup> on the right and the 2/13<sup>th</sup> on the left. The attack was to be made with full artillery support. After the Australians had secured their objective the 7/Rifle Brigade was to pass through, take Point 32 and form a bridgehead for the tanks beyond the Oxalic Line.

Colvin found the 2/13<sup>th</sup> practically without officers, and General Morshead agreed to allow all left-out-of-battle officers to be sent forward. Early that night Sergeant Easter of the 2/13<sup>th</sup>, who had a reputation for cool and reliable judgment under fire, returned from a patrol which had failed to find any sign of the 1/Gordons on the battalion's left. He expressed the opinion that there would not be much opposition to the night attack. Thereupon Colvin conferred with Colonel Simpson of the 2/17<sup>th</sup> and it was agreed to make a silent attack without artillery support. The 40<sup>th</sup> Royal Tank Regiment was to support the attack.

The 2/17<sup>th</sup> on the right advanced with two companies forward, took the objective without having to fight for it and began to dig in. The battalion's vehicles came forward but soon afterwards were shelled and bombed by aircraft. An anti-tank gun portee was set alight there as well as an ammunition vehicle in the 2/13<sup>th</sup>'s area, both providing most unwelcome illumination. Some enemy posts nearby began harassing the 2/17<sup>th</sup> with machine-gun fire as reorganization proceeded. In the right company Lieutenant Wray was a steadying influence walking through it all pipe in mouth while carrying a heavy load of mixed ammunition for one of his sections which had reported that it was running short. A vehicle in charge of Sergeant Cortis of the machine-gun platoon was hit and set alight, but Cortis coolly off-limbered a gun, got it into action, engaged some of the enemy posts and silenced them. Captain McCulloch of the left forward company was killed by machine-gun fire and the company's only remaining officer wounded; Sergeant Williams took command. The men were very weary and jaded, having been without sleep for 48 hours and throughout that time frequently under intense fire.

On the left the 2/13<sup>th</sup> had encountered machine-gun fire after about 500 yards but advanced through it. The right company surprised two posts and took the occupants prisoner. By 3.15 a.m. the troops were digging in on the objective with patrols out. The enemy began to lash the forward companies with machine-gun fire from close in front, but the 40<sup>th</sup> Royal Tanks came up behind and effectively engaged the enemy nests with tracer machine-gun fire. At 4.50 a.m. contact had been made with the Gordons on the left. By 7 a.m. shallow digging had been completed and supporting arms sited.

Before dawn the air was raucous with the noise of tanks approaching from the rear but the 7/Rifle Brigade had not yet appeared when the horizon showed the first signs of approaching day.

The break-out battle was soon to reach its climax. On the Highland front the main tank force of the 1<sup>st</sup> Armoured Division (2<sup>nd</sup> Armoured Brigade) had been moving up to the Oxalic line except on the division's left where an enemy strong-point, which the division had lacked the strength to attack, still held out to the right of the gallant 7/Black Watch. It was beyond the Highlanders, however, where the southern bridgehead reached across the Miteiriya Ridge that the battle's most dramatic developments had been occurring that night. An hour and a half had been allowed to the sappers to clear lanes forward for each armoured regiment before, at 10 p.m., the guns fired the barrage behind which the three armoured brigades of the 10<sup>th</sup> Armoured division were to

debouch. The time proved all too short and the enemy, as could hardly have been otherwise, was expectant and ready for counter-strokes.

The 8<sup>th</sup> Armoured Brigade, in the centre, encountered the greatest misfortune. On one lane (Hat Track) the enemy captured the mine reconnaissance party and the exit was covered by at least one 88-mm gun. The lane was abandoned. It was then decided that two regiments, the Nottinghamshire Yeomanry and 3rd Royal Tanks, would use the Boat track but enemy aircraft reconnoitered with flares when the bombardment opened and the Notts Yeomanry were bombed with high explosive and incendiaries and shelled, so that the lane was soon illuminated by burning vehicles, in the light of which the column was harassed by enemy fire. It was decided that this lane was also unusable. The commander of the 10<sup>th</sup> Armoured Division, General Gatehouse, who was on the Boat track, had seen all this. Lumsden called for a report from Gatehouse.

Irreconcilable accounts have been given of the incidents that followed in which Montgomery, Lumsden and Gatehouse figured and the "friction of war" manifested itself and to which perhaps too much publicity has since been given. It must suffice to recount some salient facts that do not appear to have been disputed. Gatehouse feared that daylight would find his regiments exposed and vulnerable and likely to be shot to pieces by the enemy's anti-tank artillery. Lumsden, who had no authority to break off the attack, reported this to army headquarters, which was also keeping closely in touch through report centres and by analyzing what could be heard of the much-jammed radio traffic. De Guingand concluded that "a feeling in some quarters was creeping in which favoured suspending the forward move, a pulling back under cover of the (Miteiriya) ridge" and decided to take what was apparently regarded as a risk even on that battlefield. He woke the army commander and called a conference with the corps commanders for 3.30 a.m.

Three of the four armoured brigades to make the advance to the Pierson line had encountered no insuperable difficulties or problems beyond those to be expected in such a difficult operation. It is understandable, therefore, that the army commander should have decided that the operation should proceed, for he could expect at least some 400 tanks to debouch. He gave very firm instructions that they should. The original orders were partly changed, however, presumably in recognition of the fact that only one of the 8<sup>th</sup> Armoured Brigade's three lanes - the Bottle Track on which the Staffordshire Yeomanry were to debouch - was regarded as usable. One of the brigade's three regiments was to advance and link with the New Zealand division's 9<sup>th</sup> Armoured Brigade but the rest of the brigade was to remain on the Miteiriya Ridge and improve the gaps. After the conference Montgomery kept Lumsden behind and (he has since written) 'spoke very plainly to him ... Any wavering or lack of firmness now would be fatal. If he himself, or the commander 10<sup>th</sup> Armoured Division, was not 'for it', then I would appoint others who were.'

Gatehouse was no less averse than Morshead to accepting orders to commit his troops to operations which he thought unjustifiable but by comparison was less advantageously placed, not deriving his authority directly from a government. Lumsden wished Gatehouse to receive the instructions from the army commander himself. Gatehouse had gone back to his main headquarters so that he could be contacted by telephone, and there Montgomery telephoned him. Montgomery spoke 'in no uncertain voice' and nettled Gatehouse by ordering him 'to go forward at once and take charge of his battle'.

The orders were masterful. It remains to see what effect they had on the battle. At dawn on the 25<sup>th</sup>, on the left of the 9<sup>th</sup> Division's area revealed the Queen's Bays deploying among the infantry close to the end of the bridgehead; the tank commanders, dressed with great individuality for the hunt and bedecked with colorful cravats, standing up in their cockpits unperturbed by the battle-fire's cacophony and coolly surveying the terrain. There and for some considerable distance to the South the armoured brigades tanks sat about the foremost defended localities, the target of a vigorous bombardment, as if the limit of their advance had been reached. However hard and however often the "GO" button had been pressed on the army control panel, its impulses were not motivating these tanks whose commanders, though as brave as they were bizarre, evinced no intention to advance 'at all costs' to the Pierson bound. Their presence there to do battle was not very welcome to the infantry who regarded the ground of the armour's choosing as their own. Meanwhile, about 6 a.m., part of the 7/Rifle Brigade had arrived in rear of the 2/13<sup>th</sup>'s forward companies where their vehicles attracted heavy fire, having insufficient space between the minefields for proper dispersal.

The enemy gunners were not too proud to shoot at sitting ducks. The carnage was terrible to watch.... It was not long before a flood of casualties swamped the 2/13<sup>th</sup> RAP, which was already working at full pressure to cope with the unit's own casualties. Captain Phil Goode and his men were equal to the occasion.

On the morning of the 25<sup>th</sup> Freyberg persuaded Leese and Montgomery to cancel the proposed southward infantry attacks of the New Zealand division. Freyberg thought that the main infantry attack had not failed by much to pierce the enemy's defence girdle and that, therefore, a further westward infantry attack on the pattern of the first should be made to extend the bridgehead. Again, the top commanders conferred at the New Zealand division's headquarters. Montgomery decided about midday to cancel the New Zealand division's "crumbling" operations because they were likely to prove very costly, and instead to start "crumbling" on the northern flank, using the 9th Australian Division. The armour was to be withdrawn except on the north of the XXX Corps front (where the 1st Armoured Division took the 24th Armoured Brigade under command), and in the far south the XIII Corps was to go over entirely to the defensive.

A counter-attack was expected on the 2/48<sup>th</sup>'s front but did not develop. At dusk an enemy group was seen near the forward companies and fired on. Several Germans were killed and three captured including the acting commanders of the 125<sup>th</sup> *Regiment* and that regiment's *II Battalion*. The battalion commander had a map of the area to be attacked that night showing the enemy's minefields and the disposition of his troops. The map showed that the track leading to Trig 29 along which Hammer's carriers were to advance was free of mines; this was confirmed by Hammer's interrogation of the prisoners. Interrogation also established that the Germans had just reinforced Trig 29.

To have captured the map was rare good fortune. When it was studied at Whitehead's headquarters, it revealed that the planned axis of the 2/24<sup>th</sup>'s attack ran straight along the leg of a minefield. The forming-up place and bearing of attack were therefore altered so that the sappers, instead of having to clear mines to a depth of 1,000 yards or more, would require to make only one gap 200-yards deep.

The 2/17<sup>th</sup> relieved the 2/48<sup>th</sup> at 10 p.m. on the 25<sup>th</sup>. The barrage opened at midnight and the leading companies of the 2/48<sup>th</sup> moved forward on foot; Captain Robbins' company on the right and Captain Shillaker's on the left. They pressed on through enemy defensive fire - which became particularly heavy on the right - to their intermediate objective some 200 yards short of Trig 29, and halted. Then the carriers under Captain Isaksson moving four abreast with Captain Bryant's company aboard charged through with synchronized timing onto the smoky dust-shrouded centre objective as the barrage stopped.

When the carriers reached the spur the infantry leapt out and charged, one platoon coming left and one right while one went straight on to Trig 29.

As soon as the objective had been taken Colonel Hammer contacted Major Tucker and asked him to bring forward the vehicles loaded with consolidation stores, which were being held back along the track some 500 to 600 yards to the east of the point from which the attack had started. Just at that moment a stray shell hit a mine-laden truck, which with five other trucks also loaded with mines exploded with an astounding detonation. Tucker was at first dazed, but soon got the undestroyed vehicles moving and sent Captain Potter back to "B" echelon. Potter returned with five composite reorganisation stores trucks. By first light 2000 mines had been laid. Bryant's company was facing north, Shillaker's west. Edmunds' company, on the battalion's left, facing west and northwest, had linked with the 2/17<sup>th</sup> Battalion in the 2/48<sup>th</sup>'s old positions. The battalion was now firmly established, though only shallow trenches had been dug and everyone was very weary.

Meanwhile, at 12.40 a.m. the two leading companies of the 2/24<sup>th</sup> had crossed the start-line, striking northeastwards on the right of the 2/48<sup>th</sup>. It had been realized that an advance of 3,000 yards along a line of enemy posts was a difficult assignment, but the army's Intelligence service expected them to be held by Italians. On the contrary, they proved to be mainly held by Germans, and where there were Italians there were usually Germans with them.

Major Mollards's company on the right attacked along the frontal wire with one platoon in front of the wire and two on the left behind it. They fought their way forward without any serious check until less than 100 yards from the company objective when they were held up by a strong-post. This was assaulted and taken but

not before Mollard had received a disabling wound. The post was found to have a garrison of more than 40 mixed Germans and Italians and to house an 88-mm gun. Captain Mackenzie led the company forward to its objective.

The left leading company under Lieutenant Geale had to advance the prescribed distance then move left, contact the 2/48<sup>th</sup> Battalion and dig in on the northeast spur of Trig 29. This the company did but Geale was badly wounded and Lieutenant Doughan, the only surviving officer took over. Doughan was wounded later in the day and Sergeant-Major Bailey then took command. A number of posts were taken. Sergeant Berry was foremost in the affray in the attack on three of these and took two positions single-handed.

Captain Harty (on the right) and Lieutenant Greatorex followed up the centre-line, then led their companies through the forward companies towards the Fig Orchard. Each had to overcome three posts on the way. Harty's company took the Fig Orchard post, which was found to be a headquarters with offices sunk in the ground to great depth. Greatorex's company overshot the Fig Orchard and came up near the outer edge of the defences covering the heavily defended locality known as Thompson's Post. Both companies were troubled by anti-tank and mortar fire from a post 300 yards ahead. Harty and Greatorex reconnoitered to plan an assault. Greatorex was wounded (for the second time that night) and Sergeant-Major Cameron taking charge of his company got permission to withdraw it - now numbering only 14 of the 63 who started - to along-side Harty's.

The 2/24<sup>th</sup> had carried out a methodical destruction of the enemy as prescribed by the master plan, to which the number of enemy dead and prisoners bore witness, but Colonel Weir, after going forward, decided at 4 a.m. that the battalion was too depleted to hold the extended front on which his men were digging in. The forward companies were therefore withdrawn about 1000 yards where by 5 a.m. they had consolidated behind a reverse slope running northwest from Point 22 to Trig 29. On the right flank, the composite force which had been held up in its advance by fire from Thompson's Post, found itself in an exposed situation.

On that night of much action the enemy launched an attack with infantry and a few tanks against the 2/13th Battalion, following up by dark the daylight attack that had failed. Three tanks were knocked out by Hawkins mines and Treweeke's company knocked out two tracked troop carriers when they were within 60 yards. Artillery and infantry weapon fire broke up the attack. At dawn the 2/17<sup>th</sup> discerned 12 enemy tanks sitting on a ridge to the northwest, where they remained all day, harassing the Australians with guns and small-arms fire and knocking out vehicles. On the left of the divisional front the 1<sup>st</sup> Armoured Division made its morning visitation and the Australians saw 30 Sherman tanks engaging the enemy. No foolhardy attempt was made to push through the enemy gun-line and behind the coast salient.

By the evening of the 26<sup>th</sup> Montgomery had decided that the New Zealand division should be withdrawn into reserve and rested, that the 1<sup>st</sup> Armoured Division should also be drawn into reserve for refitting and relieved by the 10th and that he would rely on the 9<sup>th</sup> Division's northward attack to retain the initiative. Consequently a substantial regrouping was to be effected on the night of 27<sup>th</sup>-28<sup>th</sup>. The northward shift of the 9<sup>th</sup> Division and the withdrawal of the New Zealand division would greatly extend the front to be held by other formations. The XIII Corps was directed to make available all the infantry it could spare for operations in the north and to extend its front to include the South Africans' sector. The 4<sup>th</sup> Indian Division was to relieve the South Africans, and they in turn to relieve the New Zealanders, who would be withdrawn. The 51<sup>st</sup> Division was to relieve the 20<sup>th</sup> Australian Brigade thus enabling the 9<sup>th</sup> Division to have one brigade freed from holding duties and available to attack.

These instructions were given by Lesse to Morshead and the other divisional commanders on the night of the 26<sup>th</sup>.

The policy, laid down by Montgomery on the 26<sup>th</sup>, of continuing the attack northwards towards the sea on the 27<sup>th</sup> and succeeding days, appears to have been originally embarked on as a crumbling operation with the general object of destroying the enemy in the salient by the coast, and not with the specific intent that the armour should debouch there. At that stage a break-out point does not appear to have been indicated, nor indeed had the planning evinced any haste to get ready for a chase. No immediate intention to break out along the coast road is suggested by the written orders nor by the narrative dealing with this stage in the 9<sup>th</sup> Division's report.

With the Army Commander's brief direction to 'Attack North', consideration was given to the staging of a further attack in this area on the night  $27^{th}$  -28<sup>th</sup> October. On the arrival of XXX Corps Operation Instruction No. 85 of  $26^{th}$  October, which ordered a policy of mopping up and the completion of the capture of the final objective by all divisions on  $27^{th}$  October, it was decided to plan the further attack northwards on the night  $28^{th}$  -29<sup>th</sup> October - one night later.

In the plan submitted to the army commander by Morshead on the morning of the 26<sup>th</sup>, however, his intention had been to attack at once to seize and open up the main road from the enemy's front-line westwards for three kilometers. Perhaps it was the contemplation of this plan that implanted the idea later tentatively adopted that the armour might next debouch along the coast road. A subsidiary object of Morshead's plan was to secure the road and the area south of it for use by the division's vehicles, thus shortening its long and exposed supply and evacuation routes.

The plan was an ambitious one. The task was to be accomplished in progressive phases and required the employment of all three brigades. For the operation the 23<sup>rd</sup> Armoured Brigade less two regiments was also placed under Morshead's command, and the artillery of tile 51<sup>st</sup>, 2<sup>nd</sup> New Zealand and 10<sup>th</sup> Armoured Divisions and of three medium regiments was to be ill support. Including the division's own artillery; there would be 360 guns

Both battalions of the 20<sup>th</sup> Brigade opened their attack at 10 p.m. on 28<sup>th</sup> October. The 2/13<sup>th</sup> on the right was a depleted unit, with rifle companies averaging only 35 of all ranks, and an exhausted one, after five sleepless nights. It had attacked on two successive nights, been counter-attacked on the next two, and on the night preceding this attack had been on the move, arriving only just before dawn in an area overlooked and constantly shelled by the enemy. The troops crossed a start-line laid farther back than the plan provided but soon caught up with the barrage and had to pause until it lifted. The attack by the 2/24<sup>th</sup> on the 26<sup>th</sup> October had cleared the enemy from the ground covered in the first phase except for some isolated survivors who offered no resistance, but the enemy, apparently aiming behind the shell-burst of the British barrage, brought artillery fire down on the battalion transport and in the midst of the rear companies. The Fig Orchard, which was the first objective, was reached in 50 minutes. Captain Gillan's company dug in close behind the orchard with battalion headquarters near by. Soon Lieutenant Barrett's company and Lieutenant Vincent's passed through and continued down a track leading towards the coast. They took up position some 800 yards because the protective artillery barrage was too close. Captain Burrell's company then patrolled deeply ahead, but without making contact.

With companies barely stronger than platoons, the battalion's attack with two companies forward had inevitably been on a narrow frontage. The path taken missed enemy positions on the left flank, which now became troublesome, heavily mortaring battalion headquarters and Gillan's company. Moreover, the whole area was found to be strewn with anti-personnel mines. Casualties were mounting and it fell to Gillan's company to deal with two enemy posts which were mainly responsible. The first patrol of 10 men under Lieutenant North met with disaster when a mortar bomb landed in its midst, killing or seriously wounding all except the commander. North returned and organized a second patrol to bring his men back. Colonel Colvin had meanwhile ordered Gillan to send out another patrol with firm orders to subdue the other post. Corporal McKellar, who was given the task, moved with ten others through a minefield, attacked with grenades two machinegun crews giving covering fire to a mortar crew, and captured the guns and their crews. Next they rushed and overcame the mortar crew some 30 yards away and returned with their prisoners carrying the captured weapons. After one more post was silenced by patrol action it appeared that local opposition had at last been subdued. Meanwhile, Burrell's company had returned and dug in a short distance behind battalion headquarters.

On the left the 2/15<sup>th</sup> attacked northward from Trig 29. As the battalion was forming up it was heavily shelled and Colonel Migno and his adjutant were wounded, Magno mortally. Strange took command and led the battalion in a vigorous, well-executed attack. Advancing through machine-gun and mortar fire they encountered posts manned mainly by Italians 900 yards from the forming-up place, overcame them and secured their objectives. In the attack 89 Italians were killed and some 130 Italian and German prisoners were taken. No minefields were found and the vehicles had no difficulty in moving up. The battalion dug in. It had lost 6 killed, including Captain Jubb, a company commander, and 36 wounded; 3 men were missing. Soon after first light

two enemy tractors approached towing anti-tank guns. The guns and 22 Germans with them were promptly captured.

The fresh 2/23<sup>rd</sup> (Lieut-Colonel Evans) and the 46<sup>th</sup> Royal Tanks (Lieut-Colonel T.C.A. Clarke), who were to execute the advance to the Main road, had trained together for semi-mobile operations. To gain surprise and save time Evans planned to advance to the objective with his assault troops (one company) mounted on the tanks and two companies following on his own carriers and those of the 2/24<sup>th</sup>. By the time the 20<sup>th</sup> Brigade's attack began all were lined up ready at the forming-up place, there to await that brigade's success signal. An alerted enemy was also ready. When the barrage opened and the advance started the tanks and carriers and the men mounted on them were exposed to sharp fire. Some of the tanks, not having the assistance of moonlight as broad as that laid on for the earlier attacks, missed the marked gaps in the home minefield and were immobilized. Others, according to the diarist of the 2/23<sup>rd</sup>, moved right and left contrary to instructions to search for others gaps and "an extremely confused situation" developed, into which the enemy pumped shot and shell from weapons of every kind. In the left company, in which casualties were severe and all the officers wounded, the company sergeant-major, Warrant-Officer Joyce, rallied the survivors and led them forward without the tanks to overcome the foremost enemy positions in hand-to-hand fighting and take 40 prisoners; but elsewhere the attack did not progress.

It was decided to reset the attack and the sappers were directed to widen the gaps, but much time was lost. 'The difficulties of this period,' states the 9<sup>th</sup> Division's report, 'were added to by communications between the commanding officers of 2/23<sup>rd</sup> Battalion and 46<sup>th</sup> Royal Tanks breaking down and the headquarters of 26<sup>th</sup> Brigade and 23<sup>rd</sup> Armoured Brigade, which were situated close to each other, not being in touch.' So no doubt it appeared to the staff at divisional headquarters. Evans had lost touch because Clarke and most (if not all) of his squadron leaders had been wounded. Whitehead and Richards had gone forward together to keep closer touch.

After the gaps had been widened the advance was resumed until the tanks again reported mines. Engineer sweeping operations were undertaken but failed to discover any. It was 12.55 a.m. before the tanks moved forward again, but then they came under fire from six 50-mm anti-tank guns, whereupon they dispersed taking their infantry with them. The enemy became very active and casualties mounted fast.

The operation was developing into the type of muddle for which there were several derisive epithets in common army parlance. Colonel Evans gathered what men he could - only 60 or 70 - and organized an attack which at 3.15, after a hard fight, took the main German position with its six guns and 160 men. About that time another group of infantry and 15 tanks who were out of touch with Evans, advanced east of Evans' position towards the railway. After 800 yards they came under fire from German guns, including one 88-mm; nine tanks were knocked out and many of the infantrymen were hit. At 4 a.m., Evans reported that he was digging in about 1000 yards forward of the original FDLs because he had so few men and was not in touch with any responsible officer of the 46<sup>th</sup> RTR. The 2/23<sup>rd</sup> had suffered very severe losses in the attack, having lost 29 killed, 172 wounded and 6 missing. The casualties included 2 majors, 4 captains, and 10 lieutenants.

Meanwhile, Brigadier Whitehead had made a new plan: to attack with the 2/24<sup>th</sup> and 2/48<sup>th</sup> Battalions from the area firmly held by the 2/15<sup>th</sup>. General Morshead made the 40<sup>th</sup> RTR available to him, but the 23<sup>rd</sup> Armoured Brigade could not at such short notice give a definite time for the 40<sup>th</sup>'s arrival at the forming-up place and it became apparent that the fresh battalions would probably have insufficient time to reorganize on their objectives before daylight. Morshead, therefore, postponed the attack and ordered Whitehead to ensure that the 2/23<sup>rd</sup> was securely established and made contact with the 2/13<sup>th</sup> on its right and 2/15<sup>th</sup> on its left: the 2/24<sup>th</sup> and 2/48<sup>th</sup> were to return to their lying-up areas. The few tanks of the 46<sup>th</sup> RTR still in running order only eight - were withdrawn.

Dawn on the 29<sup>th</sup> found the 2/13<sup>th</sup> Battalion in an isolated, rather precarious position, with open left flank and a gap of 400 yards (protected, however, by an enemy-laid minefield) between the two left companies; opposite the gap were known enemy fortified posts, which might be still occupied. Behind the battalion there was an open flank for almost 1,000 yards.

From 7 a.m. onward heavy and accurate artillery fire fell on the battalion headquarters. Three shells penetrated the dug-outs; the third wounded and incapacitated Colonel Colvin, killed the adjutant, Lieutenant Pinkney, and wounded the anti-tank officer, Lieutenant Gould. Captain Jones, the command post officer, notified the catastrophe to Windeyer's headquarters and the two forward companies through his radio links. The intelligence officer (Lieutenant Maughan) who was the only officer left on the headquarters, asked brigade headquarters to find Major Daintree, the second-in-command, and in the meantime Captain Gillan had come across from his company to take charge. Major Daintree could not be found. Later it was ascertained that he had been wounded while reorganizing the transport and evacuated. Thereupon Windeyer asked Morshead to make available Captain Kelly, a former adjutant of the unit, who was then serving on divisional headquarters. Morshead agreed and promoted Kelly to the rank of major. Kelly arrived in the afternoon and took command. Finding that the four rifle companies had between them only about 100 men, he reinforced them with men from "B" Echelon and the Headquarters Company. Gillan later wrote: 'To the dazed and battered troops, it was like a shot in the arm to see Major Joe back in the fold.'

It was against the 2/15<sup>th</sup> and the 2/17<sup>th</sup>, however, that the enemy's main efforts were directed on the 29th. Fourteen tanks stood hull-down near Trig 29 all day and the whole area came under tempestuous fire. After dawn it became evident that the enemy had only a confused idea of the Australian position; several enemy vehicles drove into the Australian lines and were destroyed or captured. Later in the morning enemy infantry and tanks formed up and two counter-attacks in which both tanks and infantry were employed were directed at Trig 1 29 - one in the morning, and another in the early afternoon. The afternoon attack, which was made with greater determination, was sustained for three-quarters of an hour. Both were repelled, but on the second occasion not before six of the Australian anti-tank guns had been knocked out. At 5 p.m. the 2/15<sup>th</sup> and 2/17<sup>th</sup> sustained a still more determined attack launched at the junction of the two battalions; it was pressed until darkness fell. In coping with these attacks Colonel Simpson and his supporting artillery were greatly assisted by reports from Captain Dinning, who had moved across from his company headquarters to an exposed observation post on Trig 29 to watch the enemy's moves. It could be seen that dreadful casualties had been inflicted on the attackers. As the light faded the enemy could be observed digging in at distances varying from a quarter of a mile to a mile from the Australian front. Shortly after midnight one Italian officer drove up with a truckload of Italian wounded to the 2/27th Battalion's RAP; which was then crowded with wounded from the  $2/15^{th}$ .

Several more attacks were to be made before the enemy gave up the attempt to dislodge the 2/15<sup>th</sup> and 2/17<sup>th</sup> Battalions. The Australians' training in quick and thorough consolidation together with effective artillery protection had provided the answer to the German practice of counter-attacking quickly rather than deliberately. The enemy, unless able to counter-attack within two hours or so of the capture of a position, had little hope of breaking the front of these battalions, depleted though they were, except by a deliberate set-piece operation.

At 1.10 a.m. on the 29<sup>th</sup> the 20<sup>th</sup> Brigade assumed responsibility for the whole northern sector and the 2/23<sup>rd</sup> Battalion was placed under Brigadier Windeyer's command. After learning of plans for a renewed attack by the 26<sup>th</sup> Brigade on the 30<sup>th</sup> -31<sup>st</sup>, Windeyer ordered the 2/23<sup>rd</sup> to advance its positions 1,000 yards on the night of the 29<sup>th</sup> so as to link the northeast part of the 2/15<sup>th</sup> with the 2/13<sup>th</sup>. This was done without incident.

The break-out operation was to be a decisive attack, called SUPER-CHARGE and the plan written that day, provided that it should be delivered on the night of 31<sup>st</sup> October-1st November.

It was essential to maintain relentless pressure on the enemy until the break-out operation took place and it fell to the lot of the 9<sup>th</sup> Division to do so by renewing its northward attacks.

The 2/32<sup>nd</sup> Battalion (Lieut-Colonel Balfe) assembled for its attack on the night of the 30<sup>th</sup>, for which the accompanying barrage was to begin at 10 p.m. Before it started two officers of the battalion had been wounded by a sniper while reconnoitering - Major Joshua (who nevertheless carried on) and Captain Jacoby, wounded mortally. The two leading companies, commanded by Captains Huitfeldt and Eacott, set off ten minutes after the barrage began. Encountering no strong opposition, they soon caught up with it [the barrage]. The railway line - the intermediate objective - was reached in good time; 175 prisoners, nearly all German from the 1/361<sup>st</sup> Battalion, had been taken. After a pause on the railway line to re-form the advance continued against heavier opposition, and casualties mounted. After the forward troops had crossed the railway Colonel Balfe and

his wireless operator were on the railway line when six Germans moved forward, evidently to surrender. One drew a pistol and shot Balfe in the arm. Balfe emptied his revolver into the Germans and made off.

When the final objectives had been reached, two companies remained in reverse slope positions covering the road while two moved left and occupied an area south of the railway facing west. The engineers were clearing mine-free tracks leading forward and had begun breaking down the 12-foot railway embankments to enable vehicles to cross. But the truck bringing their explosives and equipment had not arrived and they were reduced to doing the job with shovels and using Hawkins mines for explosive charges. Within the area captured by the  $2/32^{nd}$  Battalion was a blockhouse which had been used by the enemy as a main casualty station. Three German medical officers and their orderlies remained on duty. Field Marshal Rommel had always enjoined a scrupulous adherence to the rules of war. True to these traditions and those of their service, the German doctors and orderlies toiled that night and in the following days to minister without discrimination to the wounded of both sides as they were brought in. There they were soon joined by the  $2/32^{nd}$ 's medical officer, Captain Campbell, and his men and by Captain Grice and his section of the  $2/11^{th}$  Field Ambulance.

The 2/48<sup>th</sup> Battalion under Lieut-Colonel Hammer, the 2/24<sup>th</sup> under Lieut-Colonel Weir and the 2/3<sup>rd</sup> Pioneer Battalion under Lieut-Colonel Gallasch set off in turn from the Trig 29 area, at 10.30, 10.40 and 11.00 p.m. respectively, in the wake of the 2/32<sup>nd</sup> Battalion, and each had some action on the way. Two platoons from separate companies of the 2/3<sup>rd</sup> Pioneers assaulting, separately, and saved just in time from mistaking each other for the enemy by the inimitable profanity of their language, attacked one troublesome post to the left of the track leading to the 2/32<sup>nd</sup> and overcame it in close hand-to-hand fighting, taking more than 50 prisoners.

The battalions dug in near the 2/32<sup>nd</sup> while waiting to go forward, the area being harassed by fire. A platoon of the pioneers went over to help the engineers with their task of gapping the railway embankment. The enemy had begun closing in from the west and was soon raking the gap with fire. A platoon of the pioneers and a company of the 2/32<sup>nd</sup> independently attacked the positions mainly responsible with eventual success and again some misunderstandings were sorted out by descriptive language.

Casualties were coming fast. Balfe was hit a second time and carried out and Major Joshua took command of the 2/32<sup>nd</sup>. A German 88-mm gun shot up many carriers and vehicles attempting to bring ammunition and stores forward and many did not get through, including those of one company of the 2/32<sup>nd</sup>. About 3.45 a.m., after three hours work by 50 men, the crossing over the railway was complete and the "A" Echelon vehicles of the 2/32<sup>nd</sup> companies north of the railway crossed over; but the enemy was now pressing along the railway from the west and bringing heavy fire to bear on the gap. The 2/32<sup>nd</sup> had taken up will henceforth be called the Saucer because that is what it was to look like when dawn revealed their situation to the men of the 2/32<sup>nd</sup> and that is what they, and others who later went there, called it. In the next two days the Saucer was to become the focal point in the struggle between the two armies.

The 2/24<sup>th</sup> and 2/48<sup>th</sup>, numbering scarcely 450 men between them, had meanwhile set off on their desperate eastward advance of 2,250 yards, marching to the sound of the guns - not to the distant sound of the enemy's, but in the face of the close, harsh bombardment of their own - and were strewing the desert way of a long fight with fallen wounded and dead, yet sustaining still their task with a greatness transcending its purpose. The start-lines had been laid north from the railway to Barrel Hill, but not before the 2/48<sup>th</sup> had fought for the ground by clearing a neighboring post. The barrage opened at 1 a.m.

Major Edmunds' company on the right and Captain Bryant's on the left led the advance. As they reached the road they ran into deathly fire, but with numbers dwindling pressed on and with hard hand-to-hand fighting for almost two hours forced their way through the enemy positions to the intermediate objectives. In the right company casualties came fast; Lieutenant Caple was killed assaulting a post, another platoon commander, Lieutenant Butler, was badly wounded and evacuated. Sergeant Ranford having taken command of his platoon led assaults on two posts, overcoming both, and on the second occasion damaging beyond repair two machine-guns and an 88-mm gun. Ranford, badly wounded, continued to lead his platoon, then only seven strong, until hit again.

The reserve companies also had to fight their way forward to the intermediate objective, having to deal with un-subdued enemy posts on the edge of the depleted forward companies' path. Passing through they took

the full force of the enemy's mortar and machine-gun fire. Captain Shillaker leading the right company was soon badly wounded and Lieutenant Hamilton was killed. Sergeant Derrick led the company forward but it was forced to ground near the objective. Captain Robbins' company on the left swung out to avoid a minefield and continued the advance, but the rest of the battalion lost touch with them.

After Caple had been killed and Butler wounded, Edmunds ordered Lieutenant Allen to deal with mortar and machine-gun posts that had brought his advance to a stand-still and as Allen led a successful bayonet charge against them in the face of whipping fire, Edmunds resumed the advance with only six men. Allen's platoon took 15 prisoners but suffered severely; it was reduced to three men (including him). On Allen's right Edmunds led his six men in an assault on another post but was badly wounded by machine-gun fire as they moved in. Allen, who was also wounded, was the only officer remaining to command the company's survivors, then numbering only five.

Battalion headquarters, coming up between Shillaker's and Robbins' companies, also passed through the original two forward companies and continued up the centre but soon found themselves well ahead of the forward companies and began taking casualties from enemy fire from positions near the final objective. The Regimental Sergeant Major, Warrant-Officer Legg, led an assault by five men on a post but four were lost.

Meanwhile, Captain Bryant, the only senior company commander apart from Robbins (who was still out of touch), brought up what was left of the two companies that had taken the first objective and took charge, amalgamating his with Shillaker's company (now commanded by Derrick who, though he had been hit, was still carrying on) to form a composite company of 45 men, and then, accompanied on the right by Lieutenant Allen commanding the few survivors of what was Edmunds' company, resumed the advance, organized a charge with grenades and bayonet, and overcame the post that had held up Derrick's men.

Hammer had heard no word from Robbins, whose company had pressed on close to the objective, because Robbins had been killed and all his platoon commanders and his headquarters men had been either killed or wounded. The company had been caught in open ground as it approached the end of its advance and 16 men were killed assaulting the objective. When Robbins had been killed and the officers commanding the other two platoons severely wounded, Sergeant Kibby took command and organized an attack on the objective with the survivors, perhaps a dozen men, in two converging groups. The attackers were forced to ground within 20 yards of it. Kibby jumped up and charged, hurling grenades which silenced the post, but not before he had been caught by the enemy's fire, which cut off the life of a soldier whose gallantry in this and earlier actions at El Alamein could not have been surpassed. So was the left objective assaulted on the ground that Major Mollard's company of the 2/24<sup>th</sup>, attacking from the other side, had briefly captured some months before.

Colonel Hammer called a conference of all who were now acting as commanders of what remained of his battalion and ordered that the men were to dig in and hold the ground they had attained. The battalion, now reduced to 41 men, had no communications, all signal sets having been shot up and lines mutilated. He decided that he would make contact with the 2/24<sup>th</sup> Battalion to see whether it would be feasible to hold the ground where he was, north of the road, while the 2/24<sup>th</sup> held ground south of the road. Handing over command to his adjutant, Captain Reid, who had been thrice wounded, Hammer set off alone armed only with a pistol, to find the 2/24<sup>th</sup>. Later he returned, having been shot through the face, but with two prisoners. He had found the headquarters of the 2/24<sup>th</sup>, but Weir was not there. He then ordered a withdrawal to the blockhouse, saying that he believed the 2/24<sup>th</sup> would also be withdrawing.

Colonel Weir's patrol to Thompson's Post had penetrated the outer wire without incident but was fired on soon afterwards a short range. One man killed; another was wounded as the patrol quickly withdrew. Private O'Brien, a stretcher bearer, turned back, however, and brought the wounded man out. The fire showed Thompson's Post to be very much occupied.

When Weir returned to his battalion's firm base, he was given an oral message to the effect that, because Hammer's battalion was so depleted, Hammer proposed to withdraw; so Weir decided to do likewise. Hammer, on the other hand, had decided to withdraw only because after making contact with the 2/24<sup>th</sup> while Weir was absent leading his patrol to Thompson's Post he had gathered that Weir had decided to withdraw. Still it was all for the best, and both battalions came back just before dawn to the Saucer. On the way, however, the

2/24<sup>th</sup> passed through a minefield of aerial bombs, two of which detonated. There were 28 casualties; Lieutenant Kearney and 11 others were killed and Colonel Weir so badly wounded that Captain Harty (who was a temporary captain on only three months' standing) had to take command. The devoted O'Brien moved fearlessly among the wounded, dressing all 16. Later two of the battalion's carriers came up and brought out these and other wounded just before first light.

Harty led back the 54 survivors of the 2/24<sup>th</sup> to the 2/32<sup>nd</sup> Battalion's base where they took up a position on the left of the 2/32<sup>nd</sup> Battalion. Weir was taken to the casualty station at the blockhouse and Major Gebhardt took command after first light. Of the 206 men (including only five officers) with which the 2/24<sup>th</sup> had entered the attack, 42 had been killed and 116 wounded (though some of these were still carrying on); two men were missing. The battalion had taken 48 German and 14 Italian prisoners and a formidable array of weapons: one 88-mm gun, two 50-mm guns, two 20-mm guns, 12 Spandaus, one medium mortar, one light mortar, and seven howitzers.

Hammer had also withdrawn his few - his very few - to the base at the Saucer, where they dug in just to the east of the 2/32<sup>nd</sup> Battalion. The 2/48<sup>th</sup> Battalion had taken some 200 German prisoners. It had lost 47 killed, 148 wounded and 4 were missing. Among the 18 officers who took part in the attack only four now remained alive and unwounded. On 23<sup>rd</sup> October this battalion had 30 officers and 656 other ranks; of which 21 officers and half the men had since been killed or wounded.

The prisoners taken by the division in the operation totaled 544 of which 421 (including 7 officers) were German and 123 (including 5 officers) were Italian.

In the early hours of the 31<sup>st</sup> an important reinforcement reached the small Australian force of three depleted battalions astride the main road - one which was soon to play an important and possibly decisive role in a battle which was of some importance to the Eighth Army's prospects of a successful break-out. The 289<sup>th</sup> Battery R.A., a battery of Rhodesian anti-tank gunners manning 6-pounders who had earlier been sent up from the XIII Corps to help with operations in the north and were now attached to the 2/3<sup>rd</sup> Anti-Tank Regiment, had been allotted to the 2/32<sup>nd</sup> Battalion's support. In the dark their commander sited three troops (one being still in reserve) to cover, on the right, the approaches to the crossing from north and west - this troop's guns being on either side of the crossing - and on the left, to prevent close envelopment of the 2/32nd battalion's left flank and rear by tanks moving round the front of the battalion's protective minefield and through the gap between the 2/32<sup>nd</sup> and 2/15<sup>th</sup> battalions. Here were two troops, one close to the railway and one farther out, in the gap.

Also in the Saucer the next morning were three troops of Major Copeland's 9<sup>th</sup> Battery of the 2/3<sup>rd</sup> Anti-Tank Regiment - Lieutenant Kessell's in support of the 2/32<sup>nd</sup> Battalion on its northern flank, "B" Troop and "C" Troop (in support of the 2/24<sup>th</sup> and 2/48<sup>th</sup> Battalions) being south of the railway.

A situation map showing the 9<sup>th</sup> Division's dispositions at dawn on the 31<sup>st</sup>, if one could then have been correctly drawn from the scanty information available, would have presented a vastly (and gravely) different picture from that expected to be seen on completion of the operation. The coast road was not opened nor were the well-developed defenses north and south of it cleared. It is strange that it could have been expected that they would be. The overprint map and all other information had given clear warning that the defenses about the road were formidable. There are some indications that a belief had been nurtured that the enemy was thinning out and might by then have been demoralized; but if there was some evidence to that effect there was more plain evidence to the contrary.

Dawn revealed that an enemy locality had been penetrated and there were many isolated pockets which were quickly mopped up. The 2/32<sup>nd</sup> Battalion took some 200 prisoners. Major Rosevear's company of the Pioneers, which found itself in the midst of an enemy position, took 47.

The two isolated companies of the 2/32<sup>nd</sup> Pioneer Battalion received the enemy's first attention. Captain Stevens' company, holding no ground of vantage, and under observation from the enemy on the sand-dunes, was in the worst position. Stevens sent a patrol of 17 under Lieutenant Dunn to some dunes out in front to enfilade the enemy from the flank. Some of the men were cut down by fire. Lieutenant Dunn extricated the patrol but not before all the NCOs had been killed or wounded, and more casualties were suffered as they

came out. Dunn was badly hit and Captain Owens went out and carried him back. Only four of the 17 returned unwounded. Stevens' company was pinned down, any move attracting fire, until about 10.30 a.m. when the fire ceased and a German officer approached under a white flag and advised surrender, as the alternative to annihilation. He was told, 'If you want us, come and get us', some other remarks not in the best taste were also addressed to the envoy. After he had withdrawn the Germans completed the company's encirclement and continued to lacerate it with fire throughout the morning.

Greater efforts were being made by the enemy to force the issue against the men in the Saucer to the south of Stevens' and Owens' companies, but the Australians had meanwhile received an important reinforcement. In the early hours of the morning the 40<sup>th</sup> RTR (Lieut-Colonel J.L.T. Finigan) less one squadron had been slowly moving northward, as sappers cleared a path for them, behind the enemy's original front-wire, by the track past the fig orchard which ran north to the railway along the western edge of Thompson's post. About dawn, and not without mishaps, Finigan brought his squadron past Thompson's Post and up to the 2/48<sup>th</sup> Battalion, by which time he had received orders that be was to support that battalion. There is some evidence that the purport of Finigan's assignment was that Hammer and he should organize an attack on Thompson's Post. Be that as it may, Finigan carried out to the letter his orders to support Hammer's battalion and his tanks stayed beside the 2/48<sup>th</sup> through the day, two troops - no more had space for manoeuvre between the minefields - going into hull-down positions north of the railway.

The first German counter-attack was made about 11.30 a.m. Fifteen German Mark III and Mark IV tanks advanced north of the road and swung in between the road and railway near the Barrel track while infantry advanced on their right flank. The Rhodesians' guns and the Valentines engaged them. The German tanks probably expected a "walk-over" and panic but met strong fire and steady defence and soon withdrew. The infantry attack was smashed by artillery and other fire.

The main attack on the Saucer was made in the early afternoon, again coming in from the northern side of the ridge. While the 6-pounders engaged the German tanks to the north, Valentine tanks south of the railway came forward to meet them. Two of the Rhodesian 6-pounders were put out of action but other Rhodesian guns knocked out four German tanks. The German tanks fought their way forward, knocking out many Valentines, and overran Captain Eacott's company of the  $2/32^{nd}$  Battalion, grinding in the infantry positions and taking prisoner most of the company's survivors. During the action the enemy attempted to bring forward an 88-mm gun but it was knocked out (but more British than German) and a Valentine and a German Mark III were in flames. In this action, an anti-tank gun of the  $2/3^{rd}$  Regiment wounded Gunner Schwebel whom was the least disabled, though severely injured in his arms and legs. Schwebel managed to get the other two wounded men across to the blockhouse. Typifying the spirit of defense, he returned to the gun and had it ready to fire before the next attack. It was then hit again, whereupon Schwebel seized a Bren gun and fought with the infantry.

It was decided to bring in the reserve squadron of the 40<sup>th</sup> RTR. The squadron arrived at Windeyer's headquarters. Captain Williams then guided the tanks forward under fire, at first in a jeep and later on foot, to the 2/15<sup>th</sup> Battalion, whence most went on. Soon afterwards, however, the Valentines were withdrawn from the Saucer. No other comment need be made on the performance of the commanders and crews of the Valentine tanks in the fighting on 31<sup>st</sup> October than that of the historian of the 2/48<sup>th</sup> Battalion, which had earned the right to judge how others fought: 'The courage of these men,' he wrote, 'made their action one of the most magnificent of the war.'

About 4 p.m. the German tanks attacked again from the north but eight were stopped by gunfire and as the clay ended they withdrew. They had, however, achieved part of their objective by pushing the British off the road; for in a lull in the fighting towards 5 p.m. Rosevear's company, isolated by the earlier break-through behind them, was withdrawn. That left the international blockhouse with its tireless workers, in effect, in a no-man's land. From it the enemy had permitted casualties to be evacuated throughout the day. When darkness fell the Pioneers reorganised and dug in close to the railway embankment on its south side. In the attacks on the Saucer that day, the Germans had repeatedly brought up infantry with their tanks, but on each occasion the concentrated gunfire of the defence had dispersed the infantry.

It was not until late afternoon that it was known at Morshead's headquarters just how weak the depleted battalions at the Saucer had become. It then became obvious that their strength was insufficient to

maintain the defense of the place against a violently reacting enemy, but to have given up the ground seized would have accorded neither with the army commander's plan nor with Morshead's character. The relief of the 26<sup>th</sup> Brigade by the 24<sup>th</sup> as previously contemplated would have involved, if all had gone according to plan, merely a change-over between battalions which would then have been alongside each other; a relief at the Saucer, the most hotly contested ground on the whole front, where an attack might well occur, while units were changing over, was another matter. But Morshead at once decided that it must take place. The orders were issued about 7.30 p.m. The relief, effected at night with transport using circuitous routes, was completed by 3.30 a.m., which reflected some credit on the division's standard of staff work and training. The exhausted enemy did not attack while it was proceeding.

Brigadier Godfrey took over command of units in the Saucer from Brigadier Whitehead. The 2/28<sup>th</sup> Battalion - which Lieut-Colonel Loughrey had had rebuilt after the Ruin Ridge disaster and molded in so short a time into a first-rate combatant unit - relieved the 2/24<sup>th</sup> Battalion; the 2/43<sup>rd</sup> Battalion (Lieut-Colonel Wain) relieved the 2/48<sup>th</sup>. The 2/32<sup>nd</sup> (Now back in its own brigade) and the 2/3<sup>rd</sup> Pioneers were not relieved. Brigadier Godfrey established his command post in the Saucer.

The changes in dispositions that had been made in the Saucer under pressure of attack during the afternoon had not been known when the relief orders were issued, so that the fresh battalions arriving there by night found their instructions inapplicable and the situation confused. Colonel Loughrey acted with great vigour in consulting other commanders and having his companies quickly disposed, by his own siting, in tenable positions interlocking with the other units' defenses. The improvised dispositions adopted in the dark in a precarious situation on un-reconnoitered ground were - in the words of a unit historian - 'the ultimate in unorthodoxy', but were to be proved the next day and found not greatly wanting by the ultimate test of severest attack. The defended locality's front-line (facing west) comprised one company of the 2/43<sup>rd</sup> astride the main road, then on its left two companies of the 2/28<sup>th</sup> between road and railway then on the left of the railway the depleted 2/32<sup>nd</sup> Battalion, holding a flank out towards the 2/15<sup>th</sup> defenses; the other three companies of the 2/43<sup>rd</sup> were in depth behind the two forward companies of the 2/28<sup>th</sup>, and the other two companies of the 2/28<sup>th</sup> were in depth behind the 2/32<sup>nd</sup> Battalion. Farther still to the left was the 2/3<sup>rd</sup> Pioneer Battalion. The 2/43<sup>rd</sup> faced east and north (with its northern flank platoon on Barrel Hill), the 2/28<sup>th</sup> and 2/32<sup>nd</sup> northwest and west and south-west. Thus it was astride the road itself that the defense had least depth. The men dug themselves in as best they could but the ground was in many places unyielding nor had they any head cover.

The anti-tank defense was improved by disposing a troop of the 12<sup>th</sup> Battery's guns with the 2/15<sup>th</sup> to cover the gap between that unit and the 2/32<sup>nd</sup>. (It was further strengthened the next day when the reserve troop of the Rhodesian Battery was driven in helter-skelter and established south of the railway as an attack was imminent.) A minefield had been laid on the north-west side and the front was enfiladed from the 2/15<sup>th</sup> positions by machine-guns also brought forward during the night.

The survivors of the 2/42<sup>nd</sup> and 2/48<sup>th</sup>, who bad suffered more casualties during the day, were taken back to the original front-line on the coast sector (the defenses opposite to which were still occupied by the enemy) to sleep the night and muster next morning at their saddest roll-calls ever.

Dawn on Sunday 1<sup>st</sup> November in the Saucer revealed to the incomers numerous enemies all around them, at distances only 800 to 1,000 yards away. The Germans were doubtless no less surprised than the Australians at what daylight revealed.

The enemy promptly opened fire with small arms, mortars, 88-mm guns firing airburst shells, and a variety of field guns. Most of the fire came from the west and north-west but some from the north-east and south-east. An artillery duel soon developed in which, of course, the Germans fared worst, not only because they had fewer guns but because those they had were alarmingly short of ammunition. However, it was the enemy's turn next, it seemed, when at 8.40 a.m. German dive bombers, escorted by 15 fighters, were seen making for the Australian position; but they were intercepted by British and American fighters and jettisoned their bombs on their own troops. Seven were shot down. The enemy's infantry were seen assembling about 10 a.m. and at the same time it was reported that the British Intelligence service had intercepted a message for Field Marshal Rommel ordering the 21<sup>st</sup> Armoured and 90<sup>th</sup> Light Divisions to attack the Barrel Hill salient along the axis of the road and railway. Their terms of the message indicated that Rommel thought only one

strong-point remained, which would not withstand a resolute attack. Morshead drove down to the tempestuous Saucer and conferred there with Brigadier Godfrey.

Later in the morning more troops were seen moving south-east from Sidi Rahman. Against this dangerous British outpost presumed to be so weakly held, the Germans at midday opened an attack which they were to sustain and press without much avail throughout that long day and into the night with a succession of determined and most desperate attempts to fulfill their commander's injunction to destroy it. The brunt of the attacks came in between the road and railway on the 2/43<sup>rd</sup> and 2/28<sup>th</sup> Battalions, but the 2/32<sup>nd</sup> were also in the fire fight and, good neighbors as they were, judged it better to give than to receive. Their mortars were busy throughout the afternoon and very effective.

The first attack, made in the late forenoon by about a battalion and a half of infantry in conjunction with numerous tanks, was supported by sustained artillery, mortar and machine-gun fire. At least eight 88-mm guns were firing air-burst over the Australians. Both then and throughout the day the number of tanks employed could seldom be estimated because of the dust and smoke. As the assault was coming in, the enemy was attacked by a "football team" of bombers answering a call from the division. At 12.45, six tanks were closing in on the 2/43<sup>rd</sup> from the north-west. By 1.25 one platoon of the north-east company had been thrust off Barrel Hill but the position was regained by prompt counterattack. Anti-tank fire had knocked out three German tanks and one 88-mm gun north of the 2/43<sup>rd</sup>.

In front of the 2/28<sup>th</sup> tanks advanced close to the forward companies, went into hull-down positions and fired mainly on the anti-tank guns. All four guns of Lieutenant Kessell's troop of the 2/3<sup>rd</sup> Anti-Tank Regiment were knocked out. Soon twelve 6-pounders and two 2-pounders had been put out of action. The forward troops, who in the opinion of the battalion's diarist, were 'not impressed by the close proximity of the tanks' met the challenge with sustained, accurate fire from all weapons. Casualties mounted but about 2.30 p.m. the German tanks apparently realized that their infantry could not get through and backed out. The Germans had singled out the Rhodesians for special attention. Eight of their anti-tank guns were put out of action. In a lull Major Copeland sent Lieutenant Wallder's troop across the railway to replace them and Wallder managed to get his guns into action under the enemy's observation and fire.

At 3.25 p.m. the enemy resumed the tank and infantry attack against the 2/43<sup>rd</sup> and 2/28<sup>th</sup>. This assault came in from the northern side and was pressed home against the north-west company of the 2/43<sup>rd</sup> commanded by Captain Hare, overrunning a platoon on Barrel Hill, which was captured. Hare was killed. Sergeant Joy, whose platoon had been partly overrun, reorganised his men and regained all the lost positions but one and eventually the enemy withdrew. On the 2/28<sup>th</sup>'s front the attack had fallen mainly on Captain Taylor's company and Captain Newbery's, both of whom proved inspiring leaders. The 2/28<sup>th</sup> had no artillery Forward Observation Officer nor line communication to the rear and, therefore, the artillery fire could not be directed to best effect. Some ground was given up but the attack was withstood and the forward companies held on.

Some of the German tanks pushed on past the Australian position down the road to the east towards Thompson's Post. Later - about 3.50 p.m. - 27 tanks were observed north of Thompson's Post. At the same time enemy infantry began forming up astride the road and railway about a mile or so to the west of the Australian positions, but were effectively shelled. The enemy next began probing, apparently seeking weak spots, after which an advance against the  $2/28^{th}$  was made by infantry riding on tanks and with several self propelled guns coming forward to support, but the German infantry were quickly persuaded by accurate Australian fire to go to ground. Two self-propelled guns were soon knocked out.

By 5 p.m. the enemy appeared to have accepted failure of that attack but half an hour later tanks and infantry formed up to assault from the east while from the other side about 100 infantry advanced with determination between the road and railway. These were halted by steady fire and the attack from the east did not develop.

At dusk, adopting the traditional German tactic of advancing out of the setting sun, tanks and infantry half concealed by dust and smoke attacked from the west while a simultaneous thrust was made from the north-east, covering fire was given from the ground seized on Barrel Hill. The force attacking from the north-east comprised at least three tanks and 15 lorry-loads of infantry. Again the attacks failed to penetrate the defensive fire.

The German onslaught continued after dark. An assault supported by an artillery bombardment was made at 8.30 p.m. and withstood, but the fire fight continued. Colonel Evans, appointed to take over the command of the brigade, arrived at 9.30 p.m. Soon afterwards all lines of communications to the Saucer and throughout most of the division was cut by British tanks moving forward through the divisional area. Still the fire continued to rage in the Saucer. Before it died down at 2.30 a.m. the next morning an intense British gun barrage had opened up farther south. Operation SUPERCHARGE had begun.

The 20<sup>th</sup> Brigade was harassed by shelling throughout the 1<sup>st</sup>. When the German attack opened at midday, the 2/15<sup>th</sup> now commanded by Major Grace was heavily shelled and the other battalions were also under intermittent fire. In the 2/17<sup>th</sup> an outstanding company commander, Captain McMaster, was mortally wounded.

On the afternoon of 1st November, Colonel Macarthur-Onslow of the composite force had been warned to send machine-guns, anti-tank guns and two platoons of Pioneers to strengthen the right flank of the  $2/43^{rd}$  between the railway and the main road. The thin-skinned vehicles could not get through in daylight. When Captain Williams ( $2/2^{nd}$  Machine Gun Battalion) reached the  $2/43^{rd}$ , Colonel Wain told him that as a result of the counter-attacks his battalion and the  $2/28^{th}$  were in so confined an area that it was not advisable to bring so large a force forward; instead the detachment was sited in support between both battalions. It reached its position at 3.30 a.m. on the 2nd.

During the rest of the night of the  $1^{st}$  - $2^{nd}$  the battalions of the  $24^{th}$  Brigade were reorganised so as to give each battalion more room and to bring a reserve battalion back into a position in depth. The  $2/43^{rd}$  was now north of the railway with the composite force detachment to the east, the  $2/32^{nd}$  south of the railway with-the  $2/28^{th}$  to the east. The  $2/3^{rd}$  Pioneers were on the left of the  $2/32^{nd}$  and linked with the  $2/15^{th}$ .

Throughout that fiery first day of November the infantry had received formidable support from the Desert Air Force, though targets were hard to find because of the dispersal of the enemy's vehicles.

Stark evidence of the severity of the fighting was found the next day when a patrol of the 2/32<sup>nd</sup> Battalion counted 200 enemy dead in front of that battalion's positions. The salt marsh beyond Barrel Hill was so closely pock-marked with shell holes that it would have been difficult to find a square yard that had not been cratered.

In the fighting in that area from 30<sup>th</sup> October to 2<sup>nd</sup> November, the four battalions of the 24<sup>th</sup> Brigade had 487 casualties, most of which were received before Operation SUPERCHARGE began. The 2/43<sup>rd</sup> had 43 killed (and 7 missing), the 2/32<sup>nd</sup> 21, the 2/28<sup>th</sup> 13 (and 10 missing), the 2/3<sup>rd</sup> Pioneers 14 (and 46 missing).

Thus, the 9<sup>th</sup> Division had carried out its "crumbling" mandate to attack northwards and to draw into the northern sector and upon itself as much of the enemy's fighting strength as possible while the Eighth Army was making its preparations for SUPERCHARGE. That was the division's contribution to the final break-out.

# APPENDIX L, ANNEX 3 NEW ZEALAND ENGINEER BREACHING OPERATIONS DURING OPERATION SUPERCHARGE\*

#### 151 BRIGADE, NIGHT OF 1-2 NOVEMBER

### NORTH LANE, 151 BRIGADE, NIGHT OF 1-2 NOVEMBER

Lieutenant Standish, responsible for the northernmost lane, found employment 600 yards from the start line and No. 3 Section went into action:

We cleared a lane - not many mines - the distance required, with tanks following immediately behind us. When I thought we were through all the mines and gone the distance ordered, I told the leading tanks, and all the tanks, about 30 of them, carried on past us to support the infantry who were having a pretty rough time .... I was getting hectic messages back from the infantry to hurry the tanks up as much as possible. This was altogether a pretty sticky show and we had some casualties, I forget how many.... Visibility was so bad in this show I remember, due to smoke and dust etc., that we left continuous white tape along the ground behind us as we went forward so that the tanks could see to follow us. There was supposed to be tracer to steer us, but we could never see it and had to go by compass.'

## **SOUTH LANE, 151 BRIGADE, NIGHT OF 1-2 NOVEMBER**

No. 2 Section (Lieutenant Page) was in trouble right from the start; they were under fire before they reached the start line and their trucks were soon burning. Page writes:

Things got a bit disorganised for a time and meanwhile the support vehicles started to bank up behind us. Eventually on foot and with what blokes and gear we could muster we set forth with the pack hard on our heels. Fortunately we did not, initially, encounter any mines but were in trouble almost immediately with pockets of (enemy) machine gunners in burnt out vehicles and gun pits. These fellows had been left behind by the advancing infantry. When a hold up of this nature occurred the support vehicles would come to a halt a few yards behind us. The drill was then evolved to bring one forward to shoot out the obstruction, move on to the next and repeat the process. The prisoners that accrued in the meantime we faced in the general direction of our lines and sent on their way.

We were making fairly heavy weather of it in this fashion when we discovered, I don't remember how, that John Standish was ahead according to plan, his line of advance was taped, and there didn't appear to be anybody using it at this state of the proceedings. The obvious thing to do seemed to change direction right with our column and lead them on the taped line. This was done but not if I remember rightly, without argument about lines of approach, etc. From this point on things went reasonably well. To my mind this was John Standish's night, he did a great job.

Lieutenant Page was awarded an MC for his inspiring leadership and initiative during the battle. Casualties for the night were two killed, thirteen wounded, three missing. Major Skinner's car went up on a mine but he escaped with bruises and scratches.

# CENTRAL LANE, INTER-BRIGADE BOUNDARY, NIGHT OF 1-2 NOVEMBER

Major Anderson detailed No. 3 Section to do the gapping for 6 Field Company. Lieutenant St. George had not been replaced and Sergeant Brown still commanded, but in view of the importance of the assignment the company second-in-command (Captain Goodsir) took over the conduct of the operation.

\* Extracted from New Zealand Engineers, Middle East, by Joseph F. Cody, Official History of New Zealand in the Second World War 1939-45, War History Branch, Department of Internal Affairs, Wellington, New Zealand, 1961, pages 363-369.

The section took its place behind the advancing infantry, who were soon lost in the dust and smoke of the barrage. There was no delay at first minefield, which after a quick examination appeared to be a dummy; how the second field was discovered is explained by Captain Goodsir:

Some hundreds of yards further on we ran into mortar fire and then heavy anti-tank and machine gun fire at very close range without having visually detected any suggestion of a minefield. While we were pinned down Sergeant Brown came up from the rear and reported that the two right hand trucks had gone up on mines.

Brown was told to return to the trucks and look out for the section, which would be sent back in small parties to avoid further casualties beyond the several already Sustained. Captain Goodsir saw the last sapper moving back and made another quick search for his reconnaissance party before he followed them. Instead of a gapping team organized and working he found Major Anderson and a few sappers clearing the lane by themselves. The explanation was that Sergeant Brown had been wounded and evacuated, while the men, with nobody to command them, had dispersed and taken what shelter they could find. It was fortunate that Major Anderson and Lieutenant Hermans had arrived in the former's jeep. Hermans was sent forward to try to find Captain Goodsir, who at that moment was himself looking for his 'recce' party before returning. Major Anderson found that:

Things were not so good. Sergeant Alan Freeborn (our Orderly Room Clerk) was with me and we had to take over the platoon. We taped the line, made a hasty recce for mines lifted about a dozen and it was then that we used the Scorpion it blew only one mine in passing the gap.' As a matter of fact it also nearly 'blew' Captain Goodsir, who had been missed by Lieutenant Hermans and was returning after his fruitless search.

The leading tanks, waiting impatiently for a cleared lane, were asked to subdue the enemy fire while the reserve section was brought up and the scattered No. 3 Section collected again. The sight of Sergeant Lawrence calmly getting his gapping team working so restored the confidence of the rather shaken men that they joined in the visual search for mines. Captain Goodsir took command of the augmented reserve section while Lieutenant Morgan stood by with the transport and spare men. In the morning they found that they were sharing the same piece of desert with about a hundred Italians who had decided early in the night that silence was golden.

By this time the gap had been proved, the enemy fire silenced, Lieutenant Hermans had returned from his quest for Captain Goodsir, and the advance resumed. Time was running short but the ground appeared more open and the sappers cracked on the pace. Smoldering hessian camouflage and two upturned anti-tank guns explained the lack of opposition after the pandemonium of a short time earlier. Major Anderson and Lieutenant Hermans went on ahead in the scout car to get the lie of the land. Lieutenant Hermans wrote:

We pressed on with our scout car in the lead and "Andy" getting a bit concerned because we were a bit behind schedule and time was running out. I was scanning ahead with my binoculars and remarked to Andy that there seemed to be some peculiar troop movement ahead with people moving out of our way and going out to our flanks. I couldn't make out what the "Infantry" were doing .... we came upon a derelict vehicle a hundred yards or so to our left and there seemed to be somebody taking cover behind it. We paused to take stock of the position and lo and behold! a platoon of infantry came up from our rear, deployed, and advanced on the derelict... the picture was beginning to unfold. Instead of being ahead of us the infantry was behind and the troop movement I had observed was the enemy forward troops getting out of the way when they saw or heard the column of tanks rumbling along behind us. We were just a bit lucky the tanks had caught up with us when they did or things would have been very sticky.

Regarding the tanks, Major Anderson says:

We were in contact with the tanks all the way. In fact they were treading on our heels and the Brigadier used to give me hell whenever there was a brief hold up. We marked the route with green lamps every tenth of a mile - by speedo - and the first tank to pass always knocked the lamp over. I had several "Where the b ----- h ----- are your lamps" from the Brig.'

With the armour out in the open and the sky starting to lighten, the section returned to the trucks and began to dig in. Something white attracted attention and Lieutenant Hermans went to investigate. He returned with three very nice Biretta (sic) pistols and four very shaken Italians from a dug-in tank that was flying a white flag.

The reason for the extraordinarily heavy fire the company had encountered was made clear at daylight. They had missed a 50-feet wide gap through the enemy minefield by yards and the gap had been covered by the tank, several anti-tank guns and supporting machine guns, all of which our tanks had put out of action. The minefield was put down with our own Hawkins mines hastily but effectively concealed beneath clumps of desert scrub. When the scattered No. 1 Section had been collected in the daylight it contained the lost 'recce' party. They had not seen the mines but had run into one of the anti-tank guns, which they captured and held the crew prisoner. They were then captured themselves by other Italians until the fire of our tanks presented the opportunity of parting from their captors. The cost to 6 Field Company of the night's operation was five wounded and one died of wounds, all from No. 3 Section.

### 152 BRIGADE, NIGHT OF 1-2 NOVEMBER

On the left of the attack 8 Field Company had a complicated route to follow before it could form up behind 152 Brigade and in front of the tanks, anti-tank guns, carriers and assorted vehicles that carry the supporting arms of an assaulting force.

Lieutenant Pickmere (3 Section), right, and Lieutenant Hanger (1 Section), left, advanced with their sappers in two lines fifty yards apart and with their sandbagged trucks following in line abreast. There was no information as to where mines might be found and the idea was that if the sappers prodding in front with their fixed bayonets missed the mines the trucks would connect and, by the resulting explosion, disclose the field. The keenest eyes could see no signs of disturbed sand, but the ground was hard and stony and the half-moon obscured by cloud made the going slow.

## NORTH LANE, 152 BRIGADE, NIGHT OF 1-2 NOVEMBER

The terrific din of the barrage drowned the noise of incoming missiles and five men went down - two killed - when something exploded between the two lines. The Sappers carried on until it seemed that they would be up with the forward infantry of transport following so nothing had been missed. At last there was a Dingo car that had obviously hit a mine, and when Pickmere went to investigate he saw half-buried some lengths of what appeared to be steel rail. On closer inspection it turned out to be a new type of mine - an Italian V3 anti-personnel as well as anti-tank mine, and the first encountered.

While the sappers were getting ready to give the new nuisances the primer cord treatment because nobody knew anything of their mechanism or characteristics, Lieutenant Pickmere explored the belt and found that it was only about one hundred yards wide and that beyond it the track-marks of German tanks were clearly visible. Major Reid came up at this time and the two walked perhaps a quarter of a mile farther west until they were quite convinced that it was now clear country.

When we came back the lane clearing was going well and it was not long before the sappers had the 8 or 9 mines and suspicious objects which had been located in the first 8 yd strip all set to blow up-a charge of gelignite on each and the whole connected with primer cord. We made the mistake of placing our small blistering charges of gelly on the centre of these long mines instead of over one end where the mechanism was; with the result that 2 or 3 did not go off when we detonated the line and we had to have several attempts at them. All this was wasting valuable time while the tanks were impatiently waiting to get through. Major Reid finally came up, lifted the remaining ones holus bolus and threw them clear of the lane.

# **SOUTH LANE, 152 BRIGADE, NIGHT OF 1-2 NOVEMBER**

Lieutenant Hanger had some unexpected assistance on this occasion:

Had more luck this time as we caught the Hun laying the minefield and I was able to make them pick up a few and we were able to clear our gap pretty smartly... My main trouble was a dug in tank firing 88 AP straight up our lane. A little disconcerting to have a white hot AP shell whizzing past your nose periodically through the night. One of my other troubles was a Tommy Colonel, who wanted to halt his tanks in the gap while he talked to his Brig. on the blower. However, after using a bit of good Kiwi language not usually used on a senior officer we got him moving.

Ninth Armoured Brigade, which 6 Field Company had seen safely through the minefield and which was to use the infantry objective as its start line and then, with the aid of a barrage, advance a further mile before first light and smother the enemy gun line, did not fully succeed in its mission. It did not reach its final objective although it knocked out at least seven 88-millimetre and thirty other guns, plus a dozen tanks, after an all-day fight. The brigade commander had been ordered to accept if necessary 100 per cent casualties to make good his objective, and that is very nearly what happened. The brigade left the assembly area with 133 tanks, many of which were patched up battle casualties with strange crews; some dropped out during the 25-mile approach march and it was not known exactly how many went into battle that morning, but when they were reorganised into one regiment only 35, which included some that had got up during the morning, could be mustered.

The brigade report on operations has a good word for the New Zealand sappers in spite of the trouble with the lamps:

In the centre R Wilts had been seriously held up by a field of Hawkins mines irregularly laid by our own troops, in the clearing of which 6 NZ FD COMPANY NZE, whose work throughout this operation had been of superlative quality, lost many casualties in personnel and vehicles.... The work of the sappers in lifting minefields in the dark and under enemy fire was beyond all praise, and without them the armour would never have been able to advance.

The battle went on all day and after dark (2-3 November) No. 2 Section, 8 Field Company (Lieutenant Wildey), and No. 1 Section, 7 Field Company (Lieutenant Foster), laid a protective minefield in front of the Maoris. There was no enemy interference for the reason, unknown at the time, that Rommel was too busy packing up and organising a fighting withdrawal. His first step was to put a holding force on the Fuka escarpment. The Desert Air Force was not making his problem any easier and armoured-car elements were beginning to worry at his communications. If a breakthrough occurred on a large scale the Italian division, having no transport, would have to be left as souvenirs of the battle. The large-scale breakthrough did occur and the Italians were left to contemplate an eventual safe return to sunny Italy.

The sappers passed the third day of the month widening lanes and destroying derelict tanks and captured guns. A gap had been forced through the enemy defences at last and General Freyberg was told to get his division concentrated as soon as possible after first light (4 November) and block the retreat through the Fuka position. For this assignment he was given 4 Light Armoured Brigade in addition to 9 Armoured Brigade, reduced now to a composite regiment.

The Field Companies reverted to the command of the brigades: 7 Field Company to 5 Brigade, 8 Field Company to 6 Brigade, 6 Field Company to 9 Armoured Brigade; 5 Field Park Company was divided into a water and demolitions party (Corporal Purvis) attached to Engineer Headquarters, a battle group to move with Divisional Supply Column and a rear party with Divisional Reserve Group.

Fourth Light Armoured Brigade, whose mission was to cover the Division during the advance, passed through the narrow gap soon after daybreak; 9 Armoured Brigade had collected its components under nearly impossible conditions. They were spread all over the battlefield, where columns were crossing each other's lines of advance in the darkness and each moving object created its own smoke screen of dust. Sixth Field Company eventually found its place and the column began to move south-west in a wide sweep south to avoid the battle 1 Armoured Division was still waging to the north.

Main Divisional Headquarters, which included Divisional Engineer Headquarters and part of 5 Field Park Company, went next, followed by 5 Brigade with 7 Field Company during the afternoon, and finally about dusk 6 Brigade (with 8 Field Company) got clear of the forward defended localities."

It was 1.50 a.m. on the morning of 2 November when every gun on the Corps' front opened up a terrific barrage. One hundred and fifty thousand rounds were fired on a 4000-yard front during the next four and a half hours. Under this umbrella the assault brigades advanced. New Zealand sappers worked with the British infantry, lifting mines and marking lanes through which tanks and guns could advance in close support. Shortly after 4 a.m. word came through that the first objectives had been taken, and two hours later both brigades were on their final objectives and consolidating. Meanwhile, 28 (Maori) Battalion had cleared out the enemy pocket on the right flank and linked up with the Australians. At a quarter past six 9 Armoured Brigade passed through to carry on the attack. In a fierce and most gallant battle against a powerful anti-tank screen, the three armoured regiments fought their way forward. Their casualties in tanks were extremely heavy but the result of their attack was decisive. Enemy ranks counter-attacked our salient in the afternoon, but 1 and 10 British Armoured Divisions were deployed forward in time. All but one of our armoured divisions were engaged and the entire enemy's.

Throughout the night of 2-3 November and the next morning the battle continued along the whole front. On the New Zealand sector the infantry came forward during the night, taking over from the assault brigades, and held the salient securely on 3 November while our armour widened the gap. It was clear that the enemy's resistance had been broken, and on 3 November our tactical reconnaissance aircraft observed lines of enemy transport moving west, against which the bomber force flung its full strength. On the night of 3-4 November 9 Australian Division advanced its line north towards the coast, the Highlanders advanced across the Rahman track, and early the next morning 10 Corps, including 2 NZ Division, began the chase. At the same time 13 Corps in the south advanced. What was left of the Afrika Korps, with some remnants of the Italian *Mobile* Corps, was in full retreat, leaving five Italian infantry divisions to their fate.

# APPENDIX M OPEN QUESTIONS

Question 1: Which division is the XXX Corps main effort during Operation Lightfoot? It appears to be the 2<sup>nd</sup> New Zealand Division. From section 5.1

Question 2: Is there a photo available of Abraham S. J. du Toit, South African Army? From section 5.4

Question 3: Is there a photo (or drawing) available of the 8<sup>th</sup> Army's Pram Mine Detector? From section 5.4 Yes, see <u>The Sappers' War, with ninth Australian Division Engineers, 1939-1945</u>, by Ken Ward-Harvery, published by Sakoga Pty Ltd in conjunction with 9<sup>th</sup> Division RAE Association NSW, 1992, page 73, "Diagrams... redrawn by the Author [Ken-Harvey] from 'Report on Lightfoot Operations' in War Diary AWM [Australian War Memorial] ref 5/5/13 Nov 1942".

Question 4: Is there a photo available of the 'Snail' mine marking system? From section 5.4

Question 5: Who (the 8<sup>th</sup> Army or Middle East Forces) controlled the 24 labor and pioneer companies in 'General Headquarters Reserve'? From section 5.4

Question 6: What does D.D.M.E. stand for? From section 5.4 Deputy Director Mechanical Engineering

Question 7: How did General Montgomery intend to keep the Axis infantry from withdrawing, and thus preventing his 'crumbling' operation? From section 6.1.1.

Question 8: Are copies of the Operations Orders issued for the Second Battle of El Alamein by XXX Corps, X Corps, 2<sup>nd</sup> New Zealand Division, and 10<sup>th</sup> Armoured Division (or their subordinate maneuver and engineer elements) available? From section 6.1.1.

Question 9: Are copies of the Operations Orders issued for the Second Battle of El Alamein by the 164<sup>th</sup> Leicht Afrika Division, 15<sup>th</sup> Panzer Division, the Afrika Korps, 102<sup>nd</sup> Trento Division, and the 133<sup>rd</sup> Littorio Division (or their subordinate maneuver and engineer elements) available from section 6.1.5.

Question 10: Was the Allies impression that they had achieved tactical surprise based on the Axis reaction or from intercepted and decoded Enigma transmissions? From section 6.2.6.

Question 11: What was the relationship between the 26<sup>th</sup> Infantry Battalion's "Special Group" and No. 3 Section, 8<sup>th</sup> Field Company? From section 6.4.2.3.

Question 12: Why not use the 133<sup>rd</sup> Lorried Infantry Brigade, already assigned to the 10<sup>th</sup> Armoured Division, as part of the division's attack to Phase Line Pierson on the night of 24/25 October? From section 6.6.3.

Question 13: Are copies of the Axis maps captured by Captain Rutherford on 25 October 1942 available? From section 6.9.1.1.

Question 14: Are copies of the 8<sup>th</sup> Army after action report, "Lessons from Operations October and November 1942," available? From section 7.5.

Question 15: What was the actual quantity and distribution of universal carriers with the 8<sup>th</sup> Army? From Appendix I

# APPENDIX N AUTHOR'S BIOGRAPHICAL SKETCH

William C. Schneck is a senior project engineer for the Countermine Systems Division, Night Vision and Electronic Sensors Directorate, Fort Belvoir Virginia. During Operation Restore Hope, he deployed to Mogadishu, Somalia as a subject matter expert in mine warfare. During the Gulf War, he was deployed to Southwest Asia as a Subject Matter Expert in countermine warfare with the 20<sup>th</sup> Engineer Brigade (Airborne). During Desert Shield, he trained 19 US engineer battalions in Iraqi mines and mine warfare techniques. He is currently serving as the commander of the 276<sup>th</sup> Combat Engineer Battalion. Previous military assignments include Assistant Division Engineer, 29<sup>th</sup> Infantry Division (Light), S-3, 1/170<sup>th</sup> Infantry, Battle Captain, 29<sup>th</sup> Infantry Division (Light) tactical command post; Sapper Company Commander, B/229<sup>th</sup> Engineer Battalion (Light) (Combat); and combat engineer platoon leader, 27<sup>th</sup> Engineer Battalion (Airborne) (Combat). He is a graduate of CGSC, CAS3, the Infantry Officer Advanced Course; Engineer, Armor and Infantry Officer Basic Courses, and the Sapper Leader Course. He is a Professional Engineer and holds a master's degree in mechanical engineering from Catholic University as well as a bachelor's degree in mechanical engineering from the Georgia Institute of Technology.
